ABSTRACT

"Project Assist," conducted in two elementary schools and one junior high school, tested the hypothesis that students in schools with trained instructional reading aides will read better than students in schools with either untrained aides or no aides. This report presents data on the project gathered during the 1973-1974 school year. Separate sections present a glossary of terms, an abstract, a program description, recommended answers to "decision questions" regarding continuation of the project, a summary of stated program objectives and the degree to which they were met, and miscellaneous additional information. Appendixes present reports on a variety of aspects of the program, including the following: tests of basic concepts, reading achievement, self concept, and reading attitudes that were administered to students; pupil attendance; observation of aides; teacher, aide and principal questionnaires; parent, student, teacher, and aide interviews; aides' daily activities; and topics used for staff development. Numerous tables are included in the report and the appendixes. (GH)

Note to the Reader

In this report the term "experimental group" refers to the Project Assist schools - Palm, Metz, and Martin, and the term "control group" refers to those schools which were designated as general aide comparison schools. Throughout the first project year it became increasingly obvious that this latter group could in no way be considered a control group as the term is commonly defined. There were no strict controls placed on these schools requiring them to utilize their aides in a general way only. Nor were any categorical restrictions placed on the new programs which were introduced into these comparison schools during the year. Consequently, some of the comparison schools were more like "experimental" schools than the control schools they were envisioned to be at the project outset.

GLOSSARY

1. **affective** - a term used to describe feeling or emotion instead of thought.
2. **AISD** - the Austin Independent School District.
3. **basal-reader** - a book written for students, designed at a designated level of difficulty and constructed to develop reading skills and vocabulary.
4. **Bilingual/Bicultural Project** - a federally funded program the purpose of which is to make available to minority group students a learning curriculum in their primary language that promotes appreciation of their culture.
5. **Boehm Test of Basic Concepts** - an instrument used to measure learning readiness skills of kindergarden children.
6. **California Achievement Test** - an instrument which measures ability to understand the content material presented, the performance of the student in applying concepts to problem solving, and the performance of the student in using the tools of reading and math in progressively difficult situations.
7. **classroom observer** - an external agent whose principal task is to gather data by various instruments and observe behavior in a classroom situation. (Sometimes called process evaluator).
8. **cognitive** - a term used to describe mental processes or thought.
9. **Communications Skills Project** - an AISD project funded by Model Cities and Title I. It provides additional staff, staff training, parental involvement, and special materials and equipment to four schools (Brooke, Zavala, Ortega, Blackshear) for the purpose of improving students' reading, learning, and communicating skills.
10. **context** - the situation in which the project functions; factors, both positive and negative, that prevail in the experimental and control situation, over which the Project has no control.

11. CIPO evaluation model - Context Input Processes Outcomes, the model used by the Austin Independent School District Office of Research and Evaluation to evaluate the performance, both on-going and final, of an educational program.
12. decision questions - questions concerning the effectiveness of the program, posited by system, program, and school staffs, and for which data is supplied by the evaluation staff.
13. Dolch word list - contains the 500 most common words found in many basal readers.
14. ESAA - Emergency School Assistance Act, passed by Congress in 1973 to aid schools undergoing the desegregation process.
15. ESAA Advisory Committee - Emergency School Assistance Act, an ethnically balanced group of approximately forty members of the community whose job is to comment and advise on ESAA programs.
16. encumbrance of funds - the withholding of a specific amount of money to be spent at a later time on a specific purpose.
17. EBEC - Encyclopedia Britannica Educational Corporation, the firm which produces LEIR materials and training.
18. evaluation design - an outline of a system by which the evaluation of a program will proceed.
19. experimental - in reference to Project Assist, the schools in which the reading project hypothesis is being actively introduced and tested.
20. forced-choice test - an instrument in which a student must make a selection among several answers given him in an item.
21. formative evaluation - ongoing evaluation which provides data for the revision of a program on a short term basis.
22. gain - a statistical increase; usually defined as the difference between a prescore and a postscore.
23. general aide - persons whose purpose and training is directed towards overall assistance to student and teacher.

24. G.E.D. - General Education Diploma - an equivalency of the generally conferred high school diploma.
25. Hoffman system - a mechanized learning and reading program.
26. individualized instruction - instruction which is based on the individual needs of each child. This type of instruction usually occurs in smaller groups and with a smaller teacher/learner ratio than does non-individualized instruction.
27. inputs - resources such as extra staff, training, and project activities which occur outside the classroom.
28. inservice training - any training which occurs after the start of the instructional phase of a program.
29. instructional diagnosis - the analysis by a teacher or aide of a student's learning progress. It may be oral or written.
30. instrument - a test; a measure; an evaluation tool.
31. interview - a session (between subject and process evaluator) in which data is orally given and extracted for the purpose of program evaluation.
32. item - any of various questions on a test.
33. Language Arts Fair - events held at the end of the 1973-74 school year at Metz and Palm elementary schools. Students and visitors were involved in LEIR activities, and the books written by the students throughout the year were displayed and honored.
34. Language Experience In Reading (L.E.I.R.) - a reading approach used at Metz and Palm schools. LEIR accepts the language that a child brings to school and acts upon that. This approach is based on the philosophy that what a child thinks can be said, what he says can be written, and what he writes can be read by himself and others.
35. Likert-type scale - a question format which contains a statement followed by a continuum of responses from which a person is asked to choose and designate the response most like his/hers on the statement.

Examples:

How much do you use your Project Assist aide for reading instructional activities?

1	2	3	4	5
never	rarely	sometimes	often	always

- 36. mean - the average of a set of numbers.
- 37. minority groups - ethnic groups other than Anglo/Caucasian peoples; in Austin, Texas, this phrase generally refers to blacks and/or Mexican-Americans.
- 38. N - a symbol denoting the number of units in a group.
- 39. objective - a stated goal of a program, usually very specific.
- 40. observation - a period of time during which a process evaluator witnesses and records, for the purpose of evaluation, the various functions, resources, and activities of a classroom.
- 41. outcomes - the results of the project, defined in terms of student behaviors and achievements.
- 42. (p .05) - a symbol used to describe an event which is likely to occur by chance no more than five times out of a hundred.
- 43. percent attendance - the average daily school attendance divided by the average daily school membership, expressed as a percent.
- 44. phonetic analysis - an instrument used to orally extract phonetic deficiencies and discrepancies in the students tested.
- 45. pilot project - a term used to characterize an experimental program, the effectiveness of which is being ascertained.
- 46. Piers-Harris Children's Self-Concept Scale - an instrument used to ascertain the level of self-concept in elementary and junior high age children.
- 47. post - a second administration of a test after an interval of time in order to measure individual gain or loss in areas covered by the test.
- 48. pre - an initial administration of a test that is to be administered again at a later date in order to measure individual gain or loss in areas covered by the test.
- 49. Prescriptive Reading Inventory (PRI) - an instrument which defines a student's performance solely in terms of behaviorally stated objectives he has or has not mastered.

50. preservice training - any training held for and attended by the participants of a program prior to its initiation.
51. probability - an arithmetic expression describing the likelihood of an occurrence of an event.
52. processes - in reference to Project Assist, the classroom activities which implement the project inputs and strive to yield the project outcome objectives.
53. process evaluator - see "classroom observer"
54. Pupil-Teacher Ratio (PTR) - a numerical relation describing the number of students to every teacher, i.e., 23/1.
55. questionnaire - a formulated series of questions designed to elicit written data from subjects for the purpose of evaluation.
56. random selection - a sample of the members of some total population drawn in such a way that every member of the population has an equal chance of being included.
57. reading aide - an agent whose principal task is to provide assistance to the teacher and the student in the classroom so as to measurably raise the reading level of the student.
58. reading lab - specially equipped rooms staffed and funded by Title I resources, provided for the benefit of those students who need individualized instruction on reading skills.
59. Region XIII Service Center - one of 20 Texas-funded resource centers designed to assist educational efforts in the areas in and around Austin, Texas.
60. reliability - the extent to which a test is consistent in its measuring.
61. response - in an instrument, the answer given to a question either written or verbal.
62. self-concept - a term used to describe the degree of personal esteem that a student holds for himself.
63. significant difference - a phrase used to signify that the difference between two statistics is not likely to occur more than a certain predetermined number of times by chance.

- 64.. standardized instrument - a test designed to provide a systematic sample of individual performance, scored in conformance with definite rules and interpreted in reference to certain normative information,
65. statistic - any numerical datum; an estimate of a variable.
66. statistically significant - a phrase used to describe an important numerical difference between two or more statistics.
67. structural analysis - an analysis of the proper use of words, their stems and prefixes.
68. subject - in this report, a person whose behavior is being measured in some way.
69. summative evaluation - an evaluation conducted at the end of a program, attempting to report the degree of success of that effort.
70. System Development Corporation - a firm in Santa Monica, California, which was awarded the contract for the national evaluation of ESAA pilot programs. Austin schools Palm and Brooke were randomly selected as evaluation units during the 1973-74 school year.
71. teacher aide - in reference to Project Assist, those persons whose training is geared to assistance in the area of reading achievement.
72. t-test - a statistical computation used to determine whether or not two different statistics are significantly different.
73. Title I - the first of several sections of the Elementary and Secondary Education Act. The first title is specifically intended to raise the educational levels of minority students.
74. vailidity - the extent to which a test does the job it was developed to perform.

ABSTRACT

This report presents data gathered during the 1973-74 school year on the Austin Independent School District (Austin, Texas) implementation of the ESAA I Pilot Project, locally known as Project Assist, in two elementary schools (Metz and Palm) and one junior high (Martin). The project was originally designed to test the hypothesis that students learning in schools with trained reading aides will read better than students learning in schools with untrained general aides, and better than students working in schools with no aides at all. Two comparison groups were designated as the latter two groups.

Classroom observations indicated, on the whole, that reading aides are involved in more instructional activities, use more instructional strategies, and work in classrooms more than untrained general aides do. Teacher, aide, and principal reactions to the program are, in general, positive, although aides and teachers had many suggestions for improvement of the project, particularly aide and teacher training. Parent interviews indicate that there is general community support for what Project Assist is attempting to do and the methods for accomplishing it. Students accepted reading aides as instructional personnel.

Despite problems with the achievement measures used in the evaluation, the data indicate that student reading achievement during the first project year was not appreciably different than it would have been without Project Assist. No gains were seen in self concept in the project schools. Some gains at the elementary level in attitude toward reading and school attendance were seen.

PROJECT DESCRIPTION

PROGRAM DESCRIPTION

Introduction

Project Assist is a 1973-74 pilot project in the Austin Independent School District (AISD) funded by the Emergency School Assistance Act (ESAA) for \$297,000. The program was established in response to a need to reduce the discrepancy in reading achievement between majority and minority-group students. The project focuses on the use of teacher aides as instructional reading aides who have been trained in reading instructional techniques using a specific set of reading materials. The project was designed to test the following hypothesis:

Students who are in contact with teacher aides who have had specific training in the area of reading instruction, will learn to read better than students who are in contact with teacher aides who have had no reading training, and also better than students who are in contact with no teacher aides.

The above-described three groups of students being measured in this study are:

Experimental Schools

Metz Elementary
Palm Elementary
Martin Junior High

General Aide Schools

Brooke Elementary
Ortega Elementary
Allan Junior High

No Aide Schools

Becker Elementary
Dawson Elementary
Fulmore Junior High
Travis Heights Sixth
Grade Center

There are several components to the project. These will be described in the following sections.

Teacher Aides

The project focuses on the use of instructional reading aides. These aides were to be selected from the school neighborhoods and from minority groups. Each aide in the elementary schools worked with the teachers at one grade level. Aides at the junior high level worked with classroom teachers (of either reading, English, or social studies). All the aides were placed in schools to work exclusively as instructional classroom aides on the reading task.

Training

Prior to the beginning of school, the aides were given intensive reading instructional training over a four week period. [redacted] received additional inservice training during the project year. Project teachers at the three project schools also received training throughout the year on the use of reading materials placed in their schools and in the effective utilization of the Project Assist aides placed in their classrooms.

In addition to the above training conducted by the project coordinator, a consultant with Encyclopedia Britannica Educational Corporation was contracted to spend 60 days in the project elementary schools during the year training aides and teachers in the use of L.E.I.R. materials and techniques.

Reading Materials

Reading materials which the aides were trained to utilize were a key feature of the project. The faculties at each of the three experimental schools selected the reading curriculum which was utilized in their school. All materials purchased were evaluated by project teachers and recommended prior to purchase of the materials by project monies.

Aides and teachers at the elementary level used a language experience approach, curriculum called Language Experience in Reading (L.E.I.R.) which was developed by Dr. Roach Van Allen. The junior high aides and teachers used a collection of materials to promote individualization of reading instruction, e.g. the newspaper, audiovisual aids, programmed reading curricula, etc.

Audiovisual equipment (recorders, projectors, record players, etc.) were also placed in the schools. Library books were bought by the project and placed in the classrooms. Some consumable materials for students', aides', and teachers' use (student workbooks, paper, laminating film, etc.) were also purchased by the project. Filmstrips and films were bought and rented to provide experiences from which students verbalized, wrote, and read. Professional resource books were also provided for teachers and aides.

Other Components and Activities

Although there was not a funded parental involvement component in the program, some project activities were initiated to promote parental involvement in the two elementary schools. Parents were recruited and trained by project staff and school staffs to publish children's books in school publishing centers.

Young Authors Fairs were held in April 1974, at Metz and Palm to celebrate this writing, illustrating and publishing of over 1,000 books at these two schools during the project year. The writing of these books was initiated by the L.E.I.R. curriculum, and the Fairs were sponsored by the project.

Evaluation was also a component of the project. A description of its activities is found in the following section.

EVALUATION DESCRIPTION

Introduction

The evaluation of Project Assist attempted to answer the following major question:

Do students who are in contact with teacher aides who have had specific training in the area of reading instruction learn to read better than students who are in contact with teacher aides who have had no reading training, and also better than students who are in contact with no teacher aides?

Additional questions to be answered revolve around several topics: program effects other than achievement, degree of program implementation, and documentation of extra-program activities which may affect the program and/or evaluation of the program.

A major focus of this evaluation is based on data gathered by classroom observations and by interviews with program and school personnel.

The following sections will describe the Project Assist evaluation design, the evaluation staff and their various activities, descriptions of the instruments used and their administration, and data analysis conducted.

Evaluation Design

The Project Assist evaluation design was drafted in August and September, 1973, and was reviewed by the A.I.S.D. Superintendent's Cabinet in October. This draft of the design included:

Decision Questions To Be Addressed By The Project Assist Evaluation
Program Objectives
Data Collection And Analysis Overview

There are three levels of decision questions: system-level, program-level, and school and classroom level. Answers to the system-level decision questions are planned to assist the Board of Trustees and the Superintendent in making decisions relative to the continuance of the program. The information would also be useful to other groups. Answers to program-level decision questions would assist those charged with implementing the program in their decision makings. Answers to school and classroom-level questions should assist those charged with making decisions at the school and classroom level, e.g., principals and teachers.

The three kinds of program objectives developed for Project Assist are:

- outcome objectives - the level of student behaviors which the program is attempting to achieve
- process objectives - the level of classroom activities which, if implemented, are expected to result in the achievement of the concurrent outcome objectives
- input objectives - the level of personnel, training, materials, and extra-classroom factors which, if achieved, are expected to result in the achievement of the concurrent process and outcome objectives.

A program objectives overview is presented on the following page. These objectives were developed by the evaluation staff, although it is recommended that they be developed by both program and evaluation staff working together.

The data collection and analysis overview sheets simply outline the appropriate instruments and analyses necessary to measure the program objectives. Also included here are populations to be measured, dates and methods of measuring, and persons responsible for all these activities.

The completed evaluation design is available for review in the A.I.S.D. Office of Evaluation.

Evaluation Staff

The project evaluation staff is composed of the following positions:

- 1 project evaluator
- 2 classroom observers
- 1 secretary

The evaluator is responsible for the evaluation of Project Assist, both formative and summative evaluation. She is responsible for the construction of the evaluation design. This responsibility includes the choice and/or design of all instruments used, data analysis, data interpretation, and all reporting (both verbal and written) to appropriate persons and groups.

The two classroom observers provide input to the above-described evaluation activities. Their main duties consist of the recording of process data in the form of classroom observations, interviews, and questionnaires. Data coding, clerical work, and data interpretation is also involved in their work.

The evaluation secretary is responsible for all clerical work and for maintaining account balances for the evaluation budget.

Evaluation Instruments

The Project Assist evaluation measured students, teachers, aides, principals, parents, and other community people. A master chart listing the various instruments used and the populations to whom they were administered is shown on the following page.

Descriptions of the instruments and the details of their administration are found preceding each separate instrument report in the Appendices. Also covered there are any problems with the instrument and/or its administration which might affect the validity of the data gathered. There were some problems in this area, so the reader is encouraged not to overlook this particular point in reviewing the results of the evaluation measures.

Data Analyses

For the most part data were analyzed using the University of Texas at Austin Computation Center facilities. Key punching services were obtained from A.I.S.D. Computation Center, the University of Texas Computation Center, and the Southwest Educational Development Laboratory. Data coding was completed by A.I.S.D. Office of Evaluation staff and outside contractors. Some data analyses were contracted by the project with Mr. Jim Sherrill of Austin, Texas.

The University of Texas at Austin EDSTAR¹ and SPSS² statistical package programs were used for most of the statistical analyses. Some special purpose programs were written by the evaluation staff and contractors Dr. Hugh Poyner and Mr. Jim Sherrill.

Detailed analysis techniques of specific data are described in the corresponding separate instrument reports in the Appendices.

¹EDSTAT (Educational Statistics) is a library of computer programs for statistical analysis of quantitative data, and was developed by D.J. Veldman and Earl Jennings of the University of Texas at Austin. It is active there as well as in other computer systems in the country.

²SPSS (statistical Package of the Social Sciences) is also a library of computer programs for analyzing data with respect to the usual descriptive statistics. The original version was developed at Stanford University by Dale Bent and Norman Nie, but has been converted for use on the University of Texas at Austin Computer System.

Needs	Outcome Objectives	Process Objectives	Input Objectives	Context Description
<p><u>I. Cognitive</u></p> <p>There is a definite need to bring the mean of minority group students' reading achievement up to that of majority group students (see Context Description for supportive data).</p>	<p><u>I. * Not all of the above data was collected by the Project Assist evaluation staff. The Project Assist P evaluator did not utilize all data collected by other evaluation efforts in the district.

** Some of the ESAA Advisory Committee members represent a given school, but each represents a segment of the Austin community.

DECISION QUESTIONS

INTRODUCTION

Decision questions can ultimately be answered only by those charged with the decision-making responsibility; however, this evaluation section attempts to summarize as clearly as possible the information that has been gathered to assist in that charge. A recommendation by the evaluation staff based upon their knowledge and interpretation of that information relative to each decision question is included in this section. Although this is considered to be a professional responsibility of the evaluation staff, decision-makers are encouraged to review in its entirety all the data presented in the total report in order to arrive at their decisions.

Decision questions to be addressed in this report were established in the fall of 1973 and were set forth in the document Evaluation Design: ESAS Pilot Project Assist 1973-74. The questions are considered below as they were presented there in the following sequence: System-Level Decision Questions, Program-Level Decision Questions, and School and Classroom-Level Decision Questions.

A. SYSTEM-LEVEL QUESTIONS

1. Is there any method of utilizing instructional aides that is more effective than the way in which they are currently used?

Recommendation:

No absolute recommendations can be made on the basis of this year's evaluation. However, there are indications (not proof) that district aides should be trained and utilized, wherever possible, as instructional personnel rather than as noninstructional staff.

Basis for Recommendation:

The hypothesis implied for the utilization of Project Assist aides currently employed has not yet been fully tested, having been under observation for only one year. The aides were not utilized as well in practice during the first project year, however, as they could have been, as measured by aide observations conducted throughout the year. This deficiency was probably due to a need for additional aide training, teacher training, and more adequate aide hiring practices.

The achievement data does not indicate any unusual gain in student achievement in the project schools, except perhaps at the sixth grade, where the gain was greater than at either of the control schools. Generally speaking, there was no difference between the project schools and the comparison schools on either self concept or attitude toward reading. There is some indication from attendance data that the project may have had a beneficial effect at Palm Elementary where attendance went up this year (the only school which increased in attendance among the 53 elementary schools in Austin).

It is the opinion of teachers in the project schools (based on their responses during interviews) that aides are very beneficial to have in the classroom as instructional persons. The aides indicated in similar interviews that they felt they made a vital contribution to student learning in their classrooms and that teachers valued their skills. Students appeared to have accepted the aides as instructional personnel, based on their responses during student interviews.

2. Is reading a good subject in which to concentrate the use of instructional aides?

Recommendation:

Reading is probably a very good area in which to concentrate instructional aides in the current project schools. However, other schools may have greater needs for instructional aides in other subject areas.

Basis for Recommendation:

Reading does appear, in the opinion of project teachers and aides, to be the proper subject area to have chosen to place aides, if only one area could be chosen. Some teachers expressed throughout the year a desire to use aides in the instruction of other skills than reading, and to be able to more freely use them in noninstructional tasks. Teacher and aide interview data serve as the basis for this recommendation.

3. Would training in one specific subject area increase the effectiveness of AISD aides?

Recommendation:

Aide training does increase the effectiveness of aides, if effectiveness is defined in terms of aide behaviors and individualization of instruction.

Basis for Recommendation:

Classroom observations indicate that trained aides work in significantly more instructional activities, work in the classroom more, and use more instructional strategies than do untrained general aides. Teacher interviews revealed that, in the opinion of teachers, aides had been of most benefit by helping to individualize instruction. Training in one specific subject area certainly generates more effective aides than little or no training, which is generally the case with AISD aides. This is apt to be particularly true in low-income areas where the aides are likely to be persons with lower educational levels than in higher socioeconomic areas.

After one year, however, trained aides have produced no unusual gains in reading achievement for students, generally speaking. This is based on Boehm, Prescriptive Reading Inventory, and California Achievement Test data.

4. At what school level would the concentration of aides be most effective?

Recommendation:

No absolute recommendations can be made on the basis of this year's evaluation. However, based on secondary observation data, it appears that at any level teachers well-trained in a particular subject area utilize instructional aides in that area better than teachers not well-trained in that subject area.

Basis for Recommendation:

Classroom observations revealed that most aides appeared to be quite active as instructional reading personnel at grades K-5. At the junior high level, they were utilized as instructional reading aides in the reading lab and by English teachers more than by social studies teachers. This difference is probably due to the lack of reading instructional training of secondary social studies teachers, and their subsequent inability to utilize or supervise auxiliary personnel for this purpose. Reading teachers at the junior high level made the best use of reading aides in junior high, a conclusion based on aide observation data.

Perhaps it could be concluded that if aides are to be used at any level to improve reading achievement of children, they should be placed with those teachers who are best trained to deal with reading problems of children and in situations which lend themselves to such instruction. Observations indicated that it was difficult for even a well-trained aide to perform adequately under the direction of a teacher untrained in the area in which the aide was trained to work, or unwilling to supervise her in that work.

5. Should ESAA funds be sought for the continuation of Project Assist?

Recommendation:

It is recommended that any future available ESAA funds be sought for the continuation of Project Assist.

Basis for Recommendation:

Teacher questionnaires, teacher interviews, and aide interviews indicated a strong request for continuation of project staff, materials, and training.

One year is inadequate to initiate a pilot project with as many potential areas for change as Project Assist and yet see a great effect. A change may or may not occur, but a one year trial is too short a time during which to discover this.

B. PROGRAM-LEVEL QUESTIONS

1. Is additional training required for aides?

Recommendation:

More extensive training is needed for aides than was given during the first project year.

Basis for Recommendation:

In interviews, the aides indicated a definite need for additional training, particularly in the areas of classroom management, behavior modification, L.E.I.R. (the reading curriculum used in elementary project schools), basic reading instructional skills (phonics, language parts, grammar, spelling, etc.) testing skills, and human relations skills.

In similar interviews, their teachers also indicated that additional training for aides was desirable, listing similar training needs as aides had listed. The satisfaction of teachers with their aides' training varied from teacher to teacher and from school to school.

2. Is program assistance required to effect the use of aides as planned?

Recommendation:

The evaluation data strongly suggest that additional program assistance is required to effect the use of aides as planned.

Basis for Recommendation:

During the first project year, aides and teachers did not receive as much, in-the-classroom supervision and training as was needed or wanted. During interviews with teachers and aides and through questionnaires administered to same, a frequent request was for additional classroom supervision and on-the-spot training for both aides and teachers.

It appears that successful innovation in the curriculum benefits from immediate feedback concerning its implementation in the classroom. The curriculum changes introduced by Project Assist also required that feedback. This feedback input appears to have been critical in the acceptance of school faculties to implementation of innovations during the first project year.

3. Should different or additional materials be provided?

Recommendation:

The evaluation data suggest that some additional materials are needed to fully implement the program in the project schools.

Basis for Recommendation:

The materials provided during the first year appear to have been appropriate, based on teachers' and aides' responses to questioning along this line. Some teachers and aides requested additional materials of the same nature as those provided by the project during the first project year. Teachers most often requested consumable materials, and aides most often requested L.E.I.R. resource books.

4. Is additional training required for classroom observers?

Recommendation:

Classroom observers do require more training in several areas than they received during the first project year.

Basis for Recommendation:

It became apparent from the outset of the observations, through teacher and aide interviews, that aides were nervous and uncomfortable while being observed. Aides suggested during interviews at the end of the year that in the future, evaluation personnel go through the same training as the aides, with the aides.

It was discovered through informal and formal interviews during the year with aides and teachers that it was important for classroom observers to maintain a friendly, objective relationship with aides and teachers without becoming involved as counselor or supervisor. Teachers pointed out that it was particularly important that observers avoid offering advice to aides or teachers.

It also became apparent from staff meetings throughout the year that in the future classroom observers should be given a more detailed orientation into the philosophy and procedures of the evaluation office, more responsibility for specific parts of the program evaluation, and more opportunities for input into decisions made regarding evaluation and, where appropriate, program administration.

5. Should evaluation activities be continued as planned or are alterations required?

Recommendation:

Evaluation activities and the evaluation design should be altered somewhat from those used during the first project year. Suggestions for the alteration of the evaluation design and activities are:

- The evaluation design should be changed, if possible, to designate more comparable schools as comparison schools. It is also recommended that the term "control schools" be changed formally to "comparison schools", since it is not possible to control adequately the processes, inputs, and contexts of such schools. It should be noted that no other schools in Austin are really comparable to the experimental schools, since the experimental schools were so designated because of their particularly low achievement patterns.
- The evaluation achievement instruments should be re-selected in order to provide for more consistent administrations, more interpretable data, and therefore more useful information for decision-making. The Prescriptive Reading Inventory, though no doubt a valuable diagnostic/prescriptive instrument, is not the ideal evaluation measure for this particular program.
- It is recommended that an improved training program be designed and carried out next year for informing all school personnel responsible for group testing of children of the standardized conditions under which these instruments must be administered. It was discovered this year that

standardized tests are given under many different conditions, and often the "standard" way is found wanting. Some teachers were found to lead students to give the correct answers on instruments intended for program evaluation. Some students were administered the instrument over a faulty public address system which yielded inaudible instructions. Timed tests were often given under untimed conditions, and a list of other unacceptable procedures could be given here. This situation must be corrected if evaluation is to be more than an academic exercise.

Basis for Recommendation:

A close inspection of the process, context, and achievement data indicated that the above changes in the evaluation design and activities should be made. Impromptu visits to experimental and control schools during testing periods by evaluation staff is the basis for the third recommendation made above.

Should the program design be altered?

Recommendation:

The program design appears to be appropriate and acceptable.

Basis for Recommendation:

Neither aides nor regular school staff indicated in interviews or questionnaires any difficulties great enough to warrant a change in the program design. Most teachers in questionnaires or interviews expressed enthusiasm with the design, overall management, and focus of the program.

C. SCHOOL AND CLASSROOM-LEVEL DECISION QUESTIONS

1. Should the school continue to participate in Project Assist?

Recommendation:

Teachers at all three project schools in interviews overwhelmingly requested to continue in the program next year. The vast majority of teachers who worked with instructional aides for the first time adamantly requested to have them back next year. All three principals were supportive of the project during the year, as measured by Principal Questionnaire responses, and worked cooperatively with both program and evaluation staff to implement the project.

2. Does the regular school staff need additional training for the implementation of the program?

Recommendation:

Teachers need additional training to completely implement the Project Assist program. Sufficient program staff should be provided for giving this service to teachers and aides. It is also recommended that those principals concerned with the operation of Project Assist cooperate with Project Assist staff to provide school staffs with this requested training.

Basis for Recommendation:

According to teacher interviews and questionnaires, the teachers feel a need for more training in the areas of the reading curriculum used in the project schools, planning with and for the aides, utilization of the aide in the classroom, and understanding what the project is all about.

The aides also indicated in their interviews a need for further teacher training in utilization of the aides, planning for and with the aide, understanding what the project is all about, and human relations techniques for use in resolving conflicts with aides.

IV

CONTEXT DESCRIPTION

INTRODUCTION

So many extra-program changes occurred during the first project year that any context description must consider the school environments prior to the project start and the school environments after the project started. The first of the following two sections will attempt to describe the schools as they were prior to this year, and the second section will describe those events which occurred in the project schools but which were outside the control of the project.

A third section will address the question of comparability of the designated experimental and control groups.

DESCRIPTION OF CONTEXT PRIOR TO 1973-74

The three project schools, Metz Elementary, Palm Elementary, and Martin Junior High, are located in the predominantly Mexican-American populated section of Austin, Texas, near the Colorado River. Low incomes are the rule in this neighborhood, and income levels (proportional to the Austin average) are declining because economic migration out of these areas occurs to more prosperous areas to the east and south.

The three school environments into which Project Assist was introduced could be described as inner-city schools with predominantly Mexican-American enrollments. Achievement and attendance were low, dropout rates were high, and parental involvement was very limited. The two elementary physical facilities were quite old, while the junior high is new. Palm Elementary, built in 1892, is the second oldest school building in town. Metz Elementary was built in 1916. Martin Junior High was constructed relatively recently in 1967.

Few special programs, with the exception of Title I which had been in the district since 1965, had been placed in these three schools. This Title I aid in the elementary schools had taken the form of extra curriculum and reading professionals, counselors, home visitors, kindergarten and library aides, and additional reading materials. Martin Junior High had been a Title I school until one year ago (1972-73).

Despite the investment of additional Title I monies since 1965 in these schools, rather disappointing achievement scores have been measured for the same years those monies were spent. Students in these schools score significantly lower than students in non-Title I schools on achievement tests. The achievement gap widens drastically as students become older until at grade 8 the students at Martin and Allan Junior Highs are reading about three years below non-Title I students (see Table IV-1 on following page).

**Table IV-1: CALIFORNIA ACHIEVEMENT TEST READING SUBTEST RESULTS FOR A.I.S.D.
TITLE I EIGHTH GRADERS AND NON-TITLE I EIGHTH GRADERS FOR
SPRING, 1973**

GROUP	N	VOCABULARY Grade Equiv.	COMPREHENSION Grade Equiv.	TOTAL READING Grade Equiv.
Title I	532	5.74	6.10	5.88
Non-Title I	3287	8.75	8.82	8.81

Student attendance in the three project schools was extremely low. In 1972-73, Palm Elementary students' percent of average daily attendance (ADA) was 88%, two percentage points below any of the other 54 elementary schools in town. Metz Elementary's ADA was 92 percent, one percent below the Title I elementary average and three percent below the non-Title I elementary average. Martin Junior High's percent of ADA (82%) was the lowest of all the schools in town, including elementary and secondary schools (see Table IV-2 below).

**Table IV-2: PERCENT OF AVERAGE DAILY ATTENDANCE (ADA) FOR 1972-73 FOR
TITLE I AND NON-TITLE I ELEMENTARY AND SECONDARY SCHOOLS
AND THE THREE PROJECT ASSIST SCHOOLS**

GROUP	Elementary % ADA	Junior High % ADA
Title I	93	84
Non-Title I	95	93
Project Assist Schools		
Palm	88	
Metz	92	
Martin		82

Prior to this year students at Martin Junior High dropped out of school at a greater rate than at any other school in town, even higher than at the only other Title I school (see Table IV-3 below).

Table IV-3: 1972-73 DROPOUT DATA FOR SEVENTH AND EIGHTH GRADES IN A.I.S.D. JUNIOR HIGH SCHOOLS

SCHOOL	7th GRADE	8th GRADE	TOTAL
Martin	8	17	26
Allan	5	7	12
Bedichek	2	3	5
Burnet	4	4	8
Dobie	0	1	1
Fulmore	2	6	8
Lamar	3	6	9
Murchison	0	0	0
O. Henry	0	0	0
Pearce	0	2	2
Porter	0	9	9
Webb	1	3	4

Parental involvement at Title I schools is very low compared to non-Title I schools in Austin. The reported number of 1972-73 volunteers in Title I schools is less than half the number reported for non-Title I schools, and almost nonexistent for two of the three Project Assist schools (see Table IV-4 below).

Table IV-4: NUMBER OF VOLUNTEERS/SCHOOL REPORTED IN TITLE I SCHOOLS, NON-TITLE I SCHOOLS, AND PROJECT ASSIST SCHOOLS IN 1972-73

GROUP	VOLUNTEERS/SCHOOL
Pala	2
Metz	25
Martin	1
Title I Average	19
Non-Title I Average	39

PTA enrollment is also extremely low in these three project schools.

DESCRIPTION OF CONTEXT DURING 1973-74

In addition to the context factors outlined in the previous section, several changes occurred in the three project schools just prior to and during the first project year, factors over which Project Assist had no control. These changes, some at the school level and some at the district level, drastically altered the context in which Project Assist operated during its first year.

Principal Reassignment

The first and perhaps greatest change was that the two elementary schools received new principals. Palm and Metz had previously had male Anglo principals. However, in August, 1973, just prior to the starting of school, two young Mexican-American males were assigned as principals. This reassignment came as a surprise to the two elementary faculties, and produced a predictable amount of unrest and required adjustment on the part of teachers to the new principals.

Pupil/Teacher Ratio (PTR) Reduction

Another change was the reduction of the pupil/teacher ratio in 16 Title I schools, including the two elementary schools. This grew out of negotiations between the Austin Association of Teachers and the A.I.S.D. administration. This change reduced the pupil/teacher ratio at Metz to 21.65 and to 23.42 at Palm. This reduction was not implemented until after school started, and additional teachers were hired in September and October. This required a reassignment of many students to the additional teachers. In an evaluation of the pupil/teacher reduction conducted by the A.I.S.D. Office of Evaluation, it was found that both principals and teachers in the schools in which the PTR reduction occurred noted that the most common problem was that of children having to adjust to a new teacher:

This led to conflict and confusion as children shifted loyalties, adjusted to new authority styles, and became acquainted with the new teacher. The move also led to some feeling of rejection among the children moved, and to some added discipline problems as a result of the confusion, feelings of rejection, and other attendant problems.¹

Sixth Grade Schools

In response to a U.S. federal court order on integration, A.I.S.D. implemented a sixth grade school concept. The function of these schools was to locate all Austin sixth graders in eight such schools. Their purpose was to provide integrated learning environments for sixth graders and to obviate the busing of younger elementary students to achieve this purpose.

¹Paula Matuszek: Pupil/Teacher Ratio Reduction, Formative Evaluation Report No. 2, Context Report. (Austin, Texas: Austin Independent School District, 1974) pp 3-4.

This change had several implications for the three Project Assist schools. For the first time, sixth graders did not attend Metz and Palm, and fifth graders (not sixth graders) were "senior" students on campus. It is suspected that changes for elementary students are implied by this innovation, although this evaluation did not gather any data concerning this hypothesis. This grade change also affected elementary staffing patterns: some previously sixth grade teachers became fifth grade teachers; some sixth grade teachers transferred to the sixth grade schools, etc.

This sixth grade school innovation more directly affected Martin Junior High, because Martin became one of the eight schools in addition to continuing its 7th and 8th grade programs. Additional staff, reassignment of staff and space, and a myriad of other changes accompanied this innovation, not the least of which was sixth graders' reactions, good or bad, to being "low man on the totem pole" again.

ESAA Bilingual/Bicultural Project

In addition, the ESAA Bilingual/Bicultural project was also implemented in all three Project Assist schools. This project provided additional staff to each of the two elementary project schools: 1 curriculum writer, 1 community representative (home visitor), and 7 bilingual classroom aides. At each grade level a regular classroom teacher was assigned as the bilingual teacher for that grade level. In some cases this person team-taught with a monolingual teacher. Staff development, bilingual materials, and community involvement were heavily emphasized by this program. This bilingual project had as many innovations, if not more so, than did Project Assist.

Was it too much change at one time?

It was into this rapidly changing context that the new reading curriculum, the instructional aides, staff development, and constant evaluation of Project Assist was introduced. From the above discussion it will be apparent to the reader that much change and innovation occurred in the three project schools during the 1973-74 school year. One question which must be addressed here is: "Was it too much change at one time?"

It might be appropriate to discuss this question in light of earlier writings on this subject. Giacquinta (1973) discusses the process of organizational change in schools and identifies four organizational areas which may be affected by change:

1. The primary goals or objectives of an organization and the subtasks or subgoals necessary for their attainment.
2. The composition or constitutions of members.

3. The organization's work procedures and machinery.
4. Its social structure: system of communication, authority structure, roles, and work flow system.

When the five major programs introduced into Metz, Palm, and Martin in 1973-74 are regarded in light of the above four potential areas for impact of change, the implications seem to be as outlined below:

Table IV-5: CHANGES IMPLIED AT PALM, METZ, AND MARTIN BY FIVE MAJOR PROGRAMS INTRODUCED DURING 1973-74

SCHOOLS AND PROGRAMS	GOALS* (1)	STAFF* (2)	PROCEDURES* (3)	ROLES* (4)
<u>METZ AND PALM:</u>				
Principal Reassignment	X	X	X	X
PTR Reduction		X		
Sixth Grade Schools	X	X		
ESAA Bilingual/Bicultural	X	X	X	X
ESAA Project Assist	X	X	X	X
<u>MARTIN JUNIOR HIGH:</u>				
Sixth Grade Schools	X	X	X	X
ESAA Bilingual/Bicultural	X	X	X	X
ESAA Project Assist	X	X	X	X

*These four categories represent Giacquinta's four potential areas of organizational change (see previous page for a more complete listing of these areas).

Perhaps several of the X's on the above table could be argued, but it does appear that (excluding the PTR reduction) each of the major programs introduced into the three project schools during 1973-74 causes not just one change, but several changes.

¹Joseph B. Giacquinta, The process of organization change in schools. Review of Research in Education; Fred N. Kerlinger, editor. (Itasca, Illinois: F. E. Peacock Publishers, Inc., 1973).

Even Project Assist by itself is not just one innovation but several. The various features of Project Assist also have potential areas of impact (see the following table):

Table IV-6: CHANGES IMPLIED AT PALM, METZ, AND MARTIN BY FEATURES OF PROJECT ASSIST

Project Assist Program Features	GOALS*	STAFF*	PROCEDURES*	ROLES*
Aides		X	X	X
L.E.I.R. (new reading curriculum)	X		X	
Aide and teacher training	X	X	X	X
Evaluation	X		X	X
Audio-visual Materials	X		X	

* These four categories represent Giamcquinta's four potential areas of organizational change (see previous pages for a more complete listing of these areas).

One would suspect that if current theories related to organizational change are valid, the three Project Assist schools (especially at the elementary level) could be at a point of negative return. There comes a point beyond which teachers', principals', and students' time and energy cannot be divided adequately among the various programs. At this point it could be that people will either ignore any additional suggested or even mandated changes, or they will try to do everything right and perhaps wind up not adequately implementing any of the changes.

There are, of course, other interpretations of the above data: it may be that people can accept unlimited change, or that the five major programs implemented this year at Metz, Palm, and Martin were not too many to implement at once. One researcher in the area of innovation and its effects, however, has suggested that no more than three innovations can be managed at any one time.¹ This figure of three is far below the 15 changes indicated on Table IV-5 for Metz and Palm, and the twelve changes indicated for Martin Junior High during 1973-74.

¹Personal communication from Gene Hall, author of The concerns-based adoption model: A developmental conceptualization of the adoption process within educational institutions. Paper presented at the American Educational Research Association, Annual Meeting, (Chicago: April, 1973).

A COMMON BILLBOARD

COMPARABILITY OF EXPERIMENTAL AND CONTROL GROUPS

As the note to the reader at the beginning of this report indicates, the Project Assist schools, the general aide control schools, and the no aide control schools were not entirely comparable. The tables on the following two pages are attempts to contrast the six elementary experimental and control schools and likewise the four grades 6-8 experimental and control schools involved in this evaluation on various school features which are not comparable between each of the three comparison groups.

Perhaps the greatest deterrents to comparability of Project Assist schools and the control schools are:

- Dr. Frank Guszak's reading program at Brooke Elementary. (This undergraduate education training program was probably the source of the twelve more instructional persons being present in Brooke classrooms than in Metz or Palm classrooms.)
- The higher socioeconomic status of the no aide control group compared to that of the Project Assist and the general aide control groups.
- The historically low achievement scores and attendance patterns of those schools designated as Project Assist schools. (Therefore, no other schools in A.I.S.D. were really comparable on these two counts.)

From the above points it is obvious that the evaluation design for this project is less than perfect, owing mostly to realistic, public-school kinds of restrictions on design of the evaluation plan. The reader is urged to remember the shortcomings of the design when considering the results of this evaluation.

It is recommended by the evaluation staff of Project Assist that great efforts be made prior to and during the 1974-75 school year to improve this design.

ACHIEVEMENT OF OBJECTIVES

The following pages briefly outline the attainment of the stated objectives of the 1973-74 ESAA Pilot Project Assist. There are three major categories of objectives, each category corresponding to one of the main divisions of the CIPO evaluation model. The first is Outcome Objectives, followed by Process Objectives, and then Input Objectives.

For each individual objective, there is a detailed statement of that objective, a statement of the level of attainment for that objective and an overview of the evidence relating to the level of attainment. The reader is referred to the appropriate appendices which include more technical reporting of the data collected corresponding to each objective.

Three categories of objective achievement were designated: "Probably met," "Partially met," and "Probably Not Met." (See the following page.) The word "probably" was used in two of the categories to acknowledge the fact that the evaluation of the project may not have measured all progress toward each objective.

OUTCOME OBJECTIVES

I. COGNITIVE OBJECTIVES

I.1 Increased Student Reading Achievement

LEVEL OF ATTAINMENT: Probably not met.

EVIDENCE: This objective consists of several sub-objectives, inspection of the results referred to below indicate that at most levels the achievement objective was not met.

**OVERVIEW OF THE ACHIEVEMENT OF OBJECTIVES FOR ESAA PILOT PROJECT ASSIST
1973-74**

Objective		Probably Met	Partially Met	Probably Not met
OUTCOME	1. Increased student reading achievement.			X
	2. Improved student interest in reading.		X	
	3. Improved student school attendance.		X	
	4. Improved student self concepts.			X
PROCESS	1. Reading aides will work at least 90% of school classtime in reading activities.		X	
	2. Aides will work effectively and cooperatively with teachers.	X		
	3. Teachers will have a favorable attitude toward use of aides as instructional reading aides.	X		
	4. Teachers will effectively use aides in reading activities.	X		
	5. Students will have favorable attitudes toward use of aides as instructional reading aides.	X		
INPUT	1. The aides will be from the neighborhood and/or minority groups.		X	
	2. A project staff will be hired on schedule.			X
	3. The aides will receive two weeks of pre-service reading instructional training.		X	
	4. The aides and teachers will undergo pre-school and inservice training together.		X	
	5. Teachers will receive training in the use of the specific reading materials used.	X		
	6. \$36,678 worth of reading materials will be put into the experimental schools.		X	
	7. Teachers will be trained to use the aides.		X	
	8. An evaluation team will provide continual feedback to project personnel.			X
	9. The community will have a positive attitude toward Project Assist.	X		

- I.1.a By the end of the instructional project period, August 27, 1973 - May, 1974, the mean score of students in the project Kindergarten classrooms will equal or exceed the middle socioeconomic level midyear national norm (35.3) as measured by the Boehm Test of Basic Concepts.

LEVEL OF ATTAINMENT: Probably met.

EVIDENCE:

Results of the Boehm Test of Basic Concept showed that kindergarten students in the project schools achieved a mean of 34.3, a score not significantly different from the objective score of 35.3, and considerably higher than the low socioeconomic norm of 28.4. The gain from pre to midyear was 6.8 points, significantly larger than the average gain of three points recorded for low socioeconomic children in national norming samples (see Appendix A).

It should be pointed out that Metz and Palm kindergarten students scored about the same on the Boehm during 1973-74 as during 1972-73.

- I.1.b By the end of the instructional project period, August 27, 1973 - May, 1974, a statistically ($p .05$) significantly higher number of students at each Project Assist elementary school will achieve mastery on at least 50% of the reading objectives selected* for that level as measured by the McGraw Hill CTB/Prescriptive Reading Inventory (PRI) over the level achieved on an administration of the PRI in September, 1973.

*Classroom teachers, under the supervision of the Title I Learning Coordinator and the Title I Reading Coordinator will select from the PRI those objectives which will be emphasized at their school and various grade levels during the project.

LEVEL OF ATTAINMENT: Probably not met.

EVIDENCE:

This objective was not met at grades 2, 3, and 4 at Palm and Metz (see Appendix B). Reading objectives from the PRI were not selected for emphasis by teachers at grades 5 and 6, due to an oversight by the evaluation staff.

Due to variations in the administration of the PRI (which were detected too late in the year) at the elementary general aide control schools, no comparisons between the experimental elementary group and the general aide control elementary group can be made. Comparisons between the experimental and no aide control groups favor the no aide control group. The only exception to these findings was at the sixth grade level where

the experimental students scored lower than general aide control students on pretest, but higher on the posttest. Unfortunately, the data was not coded in a manner to permit immediate statistical comparisons of the gains for these two groups at the sixth grade level.

- I.1.c By the end of the instructional period, August 27, 1973 - May, 1974, at least 60% of the students at each Project Assist junior high grade level will have increased their reading level by 1 full year as measured by the Reading Subtest of the California Achievement Test (CAT) over the level achieved on an administration of the CAT in September, 1973.

LEVEL OF ATTAINMENT: Probably not met.

EVIDENCE:

Due to inadequate communication between project evaluation staff and district employees responsible for group testing, the September, 1973, administration of the CAT did not occur. In mid fall, 1973, it was decided to use the previous year's district test scores (administered February, 1973) as the pretest and the current year's district administration test scores (administered February, 1974) as the posttest.

Thirty-four percent of the seventh graders at Martin Junior High gained one full year in reading achievement from February, 1973, to February, 1974, administrations of the CAT. Eleven percent of the eighth graders gained one full year in reading achievement during this time, based on CAT test scores.

SUMMARY:

Due mainly to inadequate communication from evaluation staff to other district personnel responsible for testing at both the district and school level, there were obvious problems with the validity and comparability of the outcome data (see Appendices A, B, and C for more detailed presentations of these problems.). It should be stated here that the evaluation staff of Project Assist will attempt to improve this communication and to standardize somewhat the unstandard conditions under which evaluation outcome measures are currently administered in the district.

However, based on the outcome data available this year, and taking into account the problems with the data, it nevertheless appears that reading achievement of Project Assist students was not greater than it would have been in the absence of the project.

II. AFFECTIVE OBJECTIVES

- II.1 The experimental students will show a statistically ($p < .05$) significantly greater interest toward reading than the other groups of control students as measured by attitudinal instruments administered to the students at the end of the school year.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. Elementary Reading Attitudinal Test

At the end of the first project year, there was no significant difference on this measure between elementary (K-5) Project Assist students and general aide control students at any grade level or as total groups. In comparisons between Project Assist and no aide control students, a significant difference at the first grade level in favor of Project Assist students was found. The difference (favoring the Project Assist group) between the total groups was very nearly significant ($p = .0575$).

2. Parent Interviews

During interviews conducted at the end of the first project year, Metz and Palm parents indicated on a three point scale (1 = no, 2 = can't decide, 3 = yes) that their children were more interested in reading this year than last year (Metz parents 2.85, and Palm parents 2.47).

3. Secondary Reading Attitudinal Test

At the end of the first project year, there was no difference in attitude toward reading between the Project Assist and the general aide control schools, except at the sixth grade level where the difference favored the general aide control students. However, the no aide control students scored significantly higher on the reading attitudinal instrument than the Project Assist students.

4. Teacher Interviews

Teachers were asked at the end of the first project year if they felt their students had shown a greater interest in reading than their students the previous year had. On a five point scale (1 = definitely no, 5 = definitely yes), the teachers' responses were not clearly positive: Palm teachers 3.1, Metz 3.2, and Martin 3.4.

5. Aide Interviews

At the end of the year, Project Assist aides were asked, "Do you feel that students' attitude toward reading has improved this year? On a 5 point scale (1 = definitely no, 5 = definitely yes) Palm aides responded 3.5, Metz 4.0, and Martin 4.2.

SUMMARY:

At the elementary level, there may have been some improvement in attitude toward reading, based on Elementary Reading Attitudinal Test scores, parent opinions, and aide opinions, but not based on teacher opinions. At the secondary level, however, except for aide opinion, the evidence tends to support the conclusion that the objective was not met. Taken as a whole, the evidence indicates that, at some Project Assist elementary levels attitude toward reading may have improved.

- II.2 The experimental students will show a significantly greater increase in school attendance than the other groups of control students as measured by an inspection of attendance records at the end of the first project year.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. AISD Department of Pupil Accounting Records

A report released by the Department of Pupil Accounting at the end of the 1973-74 school year showed that Palm's percent of attendance had gone up from 88% during 1972-73 to 89% during 1973-74. Metz's attendance had gone down from 92% to 91%, and Martin's went down from 82% to 81%.

These changes occurred in the context of a decreasing district attendance. The overall percent attendance for the district went down 1% this year, from 92% in 1972-73 to 91% in 1973-74. Palm was the only one of the 53 elementary schools in Austin to increase their percent attendance (see Appendix D).

SUMMARY:

One of the project schools (Palm) increased their attendance, and the other two project schools (Metz and Martin) decreased in attendance, in spite of the fact that Martin, at the end of the first semester, was the only junior high in the district to show a constant increase in attendance. Particularly significant was the fact that Palm was the only elementary school in Austin (with 53 elementary schools) to increase its percent attendance. With the exception of Allan Junior High (which retained the same attendance as the previous year - 85%), the schools in the two control groups dropped one percent (Brooke, Dawson, Fulmore) or two percent (Becker and Ortega).

- II.3 The experimental students will show a statistically ($p < .05$) significantly greater increase in self concept than the other groups of control students as measured by the Piers-Harris Children's Self Concept Scale at the beginning and end of the school year.

LEVEL OF ATTAINMENT: Probably not met.

EVIDENCE:

1. Piers-Harris Children's Self Concept Scale

At the third grade level, there were no differences between Project Assist students and either of the two control groups on either pre or post test measures of the Piers-Harris. Significant losses in self-concept were made by all three groups of third grade students (see Appendix E).

At the fourth grade level, general aide students began the year with a significantly higher self concept than the Project Assist students, and maintained that edge throughout the year. The Project Assist fourth graders had a significantly higher self concept at the beginning of the year than the no aide control students, but had lost that advantage by the end of the year due to a greater gain by the no aide control group. No significant change in self concept was made by Project Assist or general aide control fourth graders. However, a significant gain was seen for the no aide control fourth graders (see Appendix E).

SUMMARY:

Significant losses in self-concept were made by Project Assist third graders, and no significant change was made by fourth graders. The data strongly indicate that the self concept objective was not met.

OBJECTIVE:

1. Aides will each work at least 90% of school class time in reading activities as measured by classroom observations, aide weekly logs, and teacher and aide interviews.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. Aide Observations

The following data were gathered during 207 aide observations conducted during the second semester of the first project year:

	<u>Metz</u>	<u>Palm</u>	<u>Martin</u>	<u>Total</u>
Percent of time aide worked on instructional task	58.86	76.45	82.72	73.61
Percent of time aide worked on non-instructional task	41.14	23.55	15.96	25.95
Percent of time aide worked on reading activities	58.19	75.28	89.76	75.32

The above data indicate that aides averaged about 75% of school class time in reading activities. This falls short of the 90% objective as stated above.

2. Aide Weekly Logs

Aides were requested by evaluation personnel to fill out and return weekly logs recording how they spent their time throughout each day of the week. Not all of the logs were returned; in fact the return rate for the entire year was as low as 12% at one school. Because of this incomplete return rate, the data returned are not presented here.

When looking at those logs which were returned, it appeared that aides who returned them did not perceive that they worked at least 90% of school class time in reading instructional activities. In fact, their estimates were far lower for this activity than the aide observation figures above.

3. Teacher Interviews

All teachers at Metz and Palm and all Martin teachers who worked with Project Assist aides were interviewed in midspring, 1974. In response to a question that solicited information about the percentage of time the teacher felt his/her aide worked in various activities, the following information about amount of time aides spent on reading instructional activities was collected:

<u>Metz</u>	<u>Palm</u>	<u>Martin</u>	"What percent of school time each day does your Project Assist aide spend on:"
58.89%	77.24%	66.9%	a. Reinforcing and/or tutoring small groups or individuals
19.38%	14.41%	14.0%	b. Instructional supervision of large or total groups

Since teacher estimates of the time that their aides spent on various activities are based on the total school day instead of class time only, it can be assumed that the percentages given by teachers would be somewhat larger if based only on class time. Therefore, it can be tentatively stated that Project Assist teachers perceived that their aides (Project Assist) spent at least 90% of class time in direct instructional contact with students.

4. Aide Interviews

Interviews of Project Assist aides were conducted by evaluation staff during the month of May, 1974. A question soliciting aide estimates of the amount of time they spent on various activities yielded the following information:

<u>Metz</u>	<u>Palm</u>	<u>Martin</u>	"What percent of each day do you spend in:"
43.33%	56.83%	69.22%	a. Reinforcing and/or tutoring small groups or individuals
24.17%	22.59%	18.00%	b. Instructional supervision of large or total groups

Since the above estimates by aides are also based on the total school day rather than class time only, it can be assumed that aides felt they spent at least 90% of their class time in reading instructional activities.

SUMMARY:

It appears from data yielded by aide observations, aide weekly logs, teacher interviews, and aide interviews that aides did not each spend at least 90% of school class time in reading instructional activities. The data appear to be conflicting, but since observations are probably a more reliable source of data than personal opinions, the 90% objective was assessed to have been partially met.

It should be noted that the 90% objective was set up at the beginning of the year as an arbitrary objective by an inexperienced evaluation and program staff who thought this was a reasonable goal. However, after one year's experience of observing aides, and finding out how much time can realistically be expected to be contributed to this activity, it appears that 60% or 70% of school class time is a more reasonable goal to expect to achieve. It seems that the "best" and "most effectively utilized" aides spent no more than this amount of time each day on reading instructional tasks. There appears to be a certain amount of time consumed in setting up for lessons, moving from class to class, etc., that consumes even an effective aide's time each day. In conclusion, it appears that the "90%" part of this objective was perhaps too high an objective to be attainable, and was an unreasonable objective.

OBJECTIVE:

2. Aides will work effectively and cooperatively with teachers in teaching reading, as measured by a score of at least 3.5 on 5 point Likert-type attitudinal instruments administered to teachers and aides at the end of the year.

LEVEL OF ATTAINMENT: Probably met.

EVIDENCE:

1. Aide Questionnaire:

This instrument measured aide responses to questions about the cooperation and acceptance extended them by their school staffs. Their responses to the majority of items ranged from "agree" to "strongly agree". In addition, Project Assist aides' responses were, in general, more positive than responses from untrained general aides in the same or comparable schools (see Appendix L).

2. Teacher Questionnaires

On 5 point scales (1 = definitely disagree, 2 = definitely agree), teachers who worked with Project Assist aides agreed in the fall (4.2) that their aides enjoyed working with them. They still agreed with this statement in the spring, but to a lesser extent (3.9). In the spring, teachers agreed (4.2) that the aides in their classrooms had worked cooperatively with them this year.

3. Aide Interviews

When asked to characterize (by ratings on four scales) the work with their teachers, Project Assist aides rated it 4.4 on 5 point scales: enjoyable, cooperative, rewarding, and effective (see Appendix K). This indicates that, from the aides' point of view, they worked effectively and cooperatively with teachers.

SUMMARY:

The evidence above indicates that aides probably worked effectively and cooperatively with teachers.

OBJECTIVE:

3. The cooperating teachers will have a favorable attitude toward the use of teacher aides in teaching reading as measured by a score of at least 3.5 on 5 point Likert-type attitudinal instruments administered to the teachers at the end of the year.

LEVEL OF ATTAINMENT: Probably met.

EVIDENCE:

1. Teacher Interviews

In response to the question, "Do you feel your Project Assist aide has been effective as an instructional reading aide?" teachers responded positively on the 5 point scale (1 = definitely not, 5 = definitely yes): Palm teachers 4.41, Metz teachers 4.70 and Martin teachers 4.42.

Fifty of the 55 teachers interviewed said they would like to have a Project Assist aide again in their classroom next year.

2. Aide Interviews

Aides were asked if they felt their teachers thought they had been effective as an instructional reading aide during the year. On a 5 point scale, Palm aides responded 4.18, Metz 3.8, Martin 4.3. The responses were positive, but less so than their teachers had responded to a similar question. However, seventeen of the twenty aides said they thought their teachers would like to have a Project Assist aide in their classrooms again next year.

SUMMARY:

The above evidence indicates that teachers do have a favorable attitude toward Project Assist aides as instructional aides. In general, Project Assist aides perceive that their teachers feel this way.

OBJECTIVE:

4. Teachers will effectively utilize the skills of the aides in reading activities in their respective classrooms as measured by observation and instruments administered by the evaluation staff throughout the year.

LEVEL OF ATTAINMENT: Probably met.

EVIDENCE:

1. Teacher Interviews

Teachers in all three project schools indicated that Project Assist aides had been the greatest benefit by helping to individualize instruction for their students (see Appendix M). To the extent that individualizing instruction is an effective use of aides, this evidence offers support that the objective was achieved.

2. Aide Observation Guide

Observations revealed that, as a group, Project Assist aides worked on instructional tasks more, used more instructional strategies, and worked in classrooms more than did the control general untrained aides. To the extent that time spent in instructional activities is an effective use of aide time, this evidence indicates support for the objective. This particular evidence was corroborated by aide interviews and aide weekly logs.

It should be pointed out that the Aide Observation Guide measures quantity and frequency of aide activities, not quality. Next year's observations will attempt to provide quality measures of aide activities.

Case Studies

Even though this data is anecdotal, the case studies, "A Day in the Life of Two Project Assist Aides," the activities observed and described indicate that aides were well utilized by teachers (see Appendix O).

SUMMARY:

In general, evidence from the Aide Observation Guide, teacher interviews, aide interviews, and aide case studies indicate that Project Assist aides were utilized by their teachers to individualize instruction. They were involved in significantly more instructional activities and used significantly more instructional strategies than did untrained general aides. Based on this evidence, it appears that this objective was probably met.

OBJECTIVE:

5. The experimental students will have a favorable attitude toward the use of teacher aides in reading activities as measured by a score of at least 3.5 on 5 point Likert-type attitudinal instruments administered to the students at the end of the year.

LEVEL OF ATTAINMENT: Probably met.

EVIDENCE:

1. **Student Interviews**

Student interviews revealed that students in Project Assist schools indicated they had a positive attitude toward the aide as an instructional person (see Appendix K). Project Assist students indicated a significantly greater willingness to seek out aides for assistance in reading than did control students who had untrained general aides.

2. **Teacher Questionnaires**

Teacher responses to an item on the fall and spring teacher questionnaires about student-aide rapport indicate that students do respond positively to the Project Assist reading aides (see Appendix I).

SUMMARY:

This objective appears to probably have been met.

INPUT OBJECTIVES

OBJECTIVE:

1. The 23 reading aides will be selected from the school neighborhood and/or from minority groups as measured by payroll records.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. Payroll Records

The boundaries designated by Austin Independent School District for Metz and Palm Elementary Schools and Martin Junior High School are shaded on the attached Austin map (See Figure V-1). The boundaries for what is locally agreed to be the East Austin Community are designated with darker lines. Each aide's home has been plotted on the map and is represented by a star.

The following tables show the number of aides who lived within the neighborhood, as defined above, and if they were a minority group member.

Table V-1: RESIDENCE DISTRIBUTION OF PROJECT ASSIST AIDES

A. Number of aides who live in Metz, Palm, Martin school neighborhoods	4
B. Number of aides who live in East Austin (not included above)	7
C. Number of aides who do not live in either area described above	16
Total	27*

*The total indicates that seven new aides were hired during the year as replacements for aides who left. The addresses of only four of these new aides were available at press time.

Table V-2: BREAKDOWN OF PROJECT ASSIST AIDES BY ETHNIC GROUPS

A. Anglo	2
B. Black	4
C. Mexican-American	21

Table V-3: BREAKDOWN OF KINVICITY OF PROJECT ASSIST AIDES BY SCHOOLS

School	Anglo	Black	Mexican-American
Metz	1	1	5
Palm	1	2	4
Martin	0	1	8
Totals	2	4	17

SUMMARY:

The above data indicates that the aides were all members of minority groups with the exception of two Anglos. These two Anglos were hired because of an effort by the project coordinator to have all local ethnic groups represented among the aides hired.

The above data indicates that the objective was least met in terms of aide residence. However, six aides who did not live in the designated East Austin neighborhood did live in predominately minority neighborhoods in South Austin.

The project coordinator was hired just prior to the beginning of the preschool aide training workshop, and had three days in which to hire all the teacher aides. This short hiring time probably prevented an adequate check of applicants' residences and recruiting of applicants who lived nearer the schools.

One question raised by the analysis of aide residency is, "Is the Mexican-American (or other minority) neighborhood really confined to 'East Austin' (or some other location) in Austin?" The aide residences plotted on the Austin map appear to extend north, south, east and west. Perhaps Austin is more integrated than is sometimes believed. (See Figure V-1)

Because the proposal guidelines are not sufficiently explicit in this area and because neither hiring criteria was totally met, the project evaluator has designated this objective as "Partially Met."

Figure V-1: Project Assist Aide Residences Plotted on Austin Map

★ Aide residence

OBJECTIVE:

2. The project staff will be hired according to the following timetable as measured by inspection of payroll records:

- 1 Coordinator - July 1, 1973
- 1 Evaluator/Developer - July 1, 1973
- 2 Secretaries - July 1, 1973
- 32 Teacher Aides - August 1, 1973
- 2 Classroom Observers - September 1, 1973.

LEVEL OF ATTAINMENT: Probably not met.

EVIDENCE:

1. Payroll Records

Table V-4: HIRING DATES FOR PROJECT ASSIST STAFF

Position	Target Hiring Date	Actual Hiring Date	Days Lost Per Person	Total Days Lost
1 Project Evaluator	7-1-73	7-10-73	10	10
1 Secretary for Evaluator	7-1-73	7-17-73	17	17
1 Project Coordinator	7-1-73	8-7-73	38	38
1 Secretary for Coordinator	7-1-73	8-27-73	58	58
32 Teacher Aides	8-1-73	8-10-73	10	320
2 Classroom Observers	9-1-73	9-10-73	10	20
			Totals 143.	405

The fact that the project coordinator was hired 38 days behind schedule resulted in delays and difficulties for the rest of the staff. Since the project evaluator was hired nearest the target date, she was responsible for planning and organizing the three-week aide training session. This decreased the amount of time available to her for planning the evaluation of the program.

The evaluator was not experienced in the teaching of reading and related activities so her time was channeled into study and inquiry rather than into planning the evaluation procedures, an activity upon which she should have concentrated these first weeks. Also, the aides were hired late due to the lateness in hiring the coordinator. The ramifications of this situation were that all thirty-seven aides were hired during a three-day period. Due to this very short time period the coordinator was not allowed

adequate time to check references, qualifications, and past employment records of the applicants. Also, the training session for the aides began late; therefore they did not enter the classrooms until after school had been in session over a week. This late schedule also prevented teachers and aides from participating in any preschool training together.

The classroom observers were hired ten days late as a result of the prior missed target dates. Consequently there was inadequate time available for their training and orientation to the project. There was a loss of classroom observation time since they did not enter the schools until after mid-September.

The fact that the secretaries were hired late resulted in the evaluator and coordinator taking time from their specific duties to take care of clerical work. Interviewing applicants for the secretarial positions at the later dates took critical time away from their already rushed schedule.

SUMMARY:

In summary a total of 453 person-days were lost due to the late hiring of project personnel. Most critical was the thirty-eight day late hiring of the coordinator.

The factors contributing to the late hiring of project personnel are many and interrelated, but appear to revolve around two major ones: United States Office of Education grant approval and notification timelines, and AISD advertising and hiring procedures and the length of time required for hiring decisions. An additional factor that discouraged early hiring was the federal court order on desegregation of AISD schools that was expected throughout the summer. The uncertainty and confusion that accompanied the wait for this court decision led to many delayed hirings in the district.

OBJECTIVE:

3. Aides will undergo at least two weeks of intensive training in reading instruction techniques and materials prior to the beginning of school as measured by documentation by the project coordinator and observation by the project evaluator.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. Documentation by Project Coordinator

The 23 Project Assist reading aides who worked in the three experimental schools began a 4-week training workshop on August 13, 1973. They met daily for morning and afternoon seminars and workshops at Kealing Learning Center.

During the first session the aides met with the coordinator and evaluator to hear an overview of the project and the expectations that had been established for the reading aides. The following days sessions covered numerous topics: communication skills, human/race relations, how to teach reading skills and other reading related activities, how to construct reading instructional games, special education, learning disabilities, bilingual education policies and procedures of Austin Independent School District, how to operate audio-visual equipment and System 80 reading machines, LEIR training, etc. For a day by day description of the workshops, see the workshop agenda in Appendix P.

The aides received printed material on many of the subjects studied, and they organized a notebook concerned with various reading skills and other classroom instruction. The notebook became a quick reliable reference after the aides began work in the classroom.

The training session went into a fourth week with only afternoon sessions. The mornings of the fourth week the aides spent in the classrooms from 8:00-12:00. In the afternoon sessions the aides met at Kealing Learning Center and discussed with the project coordinator their experiences and any problems encountered.

2. Pre-school Aide Training Workshop Evaluation by Project Evaluator

At the beginning of the pre-school aide training workshop, aides were asked to rate their knowledge and skills in 19 areas. At the end of the workshop they were again asked to rate themselves in these areas. The following chart shows the average gain on these self-ratings from pre to post:

Figure V-2: 1973 PROJECT ASSIST PRE-SCHOOL AIDE WORKSHOP EVALUATION

	1. Know nothing about it.	2. Know a little bit about it.	3. Know enough about it.	4. Know everything there is to know.
	PRE-TEST		POST-TEST	
Use slide projector	1	1 2	3	4
Teach reading through newspapers	1	1 2	3	4
Design and make reading games	1	1 2	3	4
Use filmstrip projector	1	1 2	3	4
Communicate with parents about their child's reading progress	1	2 1	3	4
Teach reading using LEIR materials	1	1 2	3	4
Serve as a language model for children	1	1 2	3	4
Understand what my duties as a reading aide will be	1	2 1	3	4
Use tape recorder	1	2 1	3	4
Design and make reading materials	1	1 2	3	4
Know how to give the Informal Reading Inventory test	1	1 2	3	4
Know AIESD personnel policies on sick and vacation leave	1	1 2	3	4
Design and make a bulletin board display	1	1 2	3	4
Teach reading using "Systems 80" materials	1	1 2	3	4
Know how to make children want to learn	1	2 1	3	4
Use film projector	1	1 2	3	4
Teach reading through reading games	1	2 1	3	4
Know what teachers expect of us as a reading aide	1	1 2	3	4
Teach reading through basal readers	1	1 2	3	4

The areas of largest gain were: designing and making reading games; teaching reading through reading games, teaching reading through using LEIR, using "Systems 80" (a reading machine) to teach reading, giving an Informal Reading Inventory test, understanding their duties as a reading aide, teaching reading through newspapers, and Austin Independent School District policies about sick and vacation leave.

Although these areas did show a substantial gain, the aides did not feel they knew enough about some of the areas (3 on a 4 point scale) at the end of the workshop. The areas in which the aides rated their knowledge below 3 ("know enough about it") on the scale on the post-workshop evaluation were: use of slide projector, use of film projector, use of filmstrip projector, teaching reading through using LEIR,

know how to give an Informal Reading Inventory, teach reading through basal readers, serve as a language model for children, and communicate with parents about their child's progress in reading.

The areas in which the aides felt they were weak indicate a need for a stronger emphasis on use of audio-visual equipment, some of the methods used for teaching and/or testing reading, and communication skills which would include feeling comfortable about serving as a language model for children. The data also indicates the aides felt the workshop was successful since there was an average increase of 1.1 units (using the 1-4 scale) on all the scales they were asked to rate by the evaluation staff.

SUMMARY

Although the objective set for duration of pre-school aide training was two weeks, the program spent three weeks in this activity. A fourth week of "easing" aides into experimental classrooms on a half day basis was deemed necessary by the project coordinator, because teachers had not had a benefit of pre-school training with the aides.

The evaluation of the aide training workshop revealed that a great amount of aide learning had occurred, even though at the end of the workshop the aides felt they still did not know enough about some areas as they should. All in all, the objective appears to have been well met for those aides who began the project year as Project Assist aides.

However, it should be noted that nine of the original 23 reading aides resigned during the first project year. Seven of these aides were replaced with new untrained aides. (The other two aides were not replaced, leaving a total of only 21 reading aides in the three project schools). With a few exceptions, the replacements received little or no preservice training in reading instructional techniques from the project staff. This is based on statements made by aides during interviews at the end of the year (see Appendix N). It is suggested that an effective training program be implemented to provide necessary job skills for aides who come into the program after the beginning of the school year.

OBJECTIVE:

4. The aides will undergo a three-day training period together with teachers prior to the beginning of school, then participate in an on-going training program along with the teachers with whom they work throughout the school year, as measured by instruments administered by the evaluation staff.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. Documentation by Project Coordinator

There were fifteen occasions throughout the year when aides and teachers were trained together (see Appendix P):

Pre-school Workshops	2 (Palm staff)
Professional Conferences (TAIR, etc.)	4 (All staff)
Materials Evaluation Meetings	2 (Martin staff)
LEIR Training Sessions	26 (Metz and Palm staff)
Planning for Young Authors Fairs	2 (Metz and Palm staff)
Parent Involvement Sessions	1 (Palm staff)

Total Number of Sessions Involving Aides and Teachers Together 37

Only three of these meetings were held at the junior high project school. The junior high aides did attend monthly school meetings of the reading staff. They also attended two district-sponsored inservices for reading personnel during Conference days (see Appendix P).

2. Aide Interviews

In interviews done at the end of the year, several aides requested that aides be trained more on the same topics as teachers with teachers, so they would know more what the teachers expected of them, and so teachers would know what aides could do (see Appendix N).

3. Teacher Interviews

Teachers expressed a similar desire for joint teacher/aide training, so they would know better what aides could do and were supposed to do (see Appendix M).

4. Teacher Questionnaires

When questioned about their willingness to attend preschool workshops with aides, teachers at all three project schools agreed they would like to attend if paid a stipend. They suggested that a 3-5 day workshop would be ideal for them (see Appendix I).

SUMMARY:

Aides and teachers did attend joint training sessions during the first project year (37--only 24 of which included all teachers and all aides). However, aides and teachers indicated through interviews and questionnaires that the amount and/or types of training provided was not adequate to meet the joint training needs that the project professionals and paraprofessionals working together in the same classroom say they have.

Aides and teachers did not receive the three days of joint in-service training before school started. (Palm teachers and aides received one day of training together at this time, and Martin teachers attended one afternoon session).

OBJECTIVE:

5. The teachers at each experimental school will receive specific training in the use of reading materials selected by each school as measured and documented by the Project Evaluator and other project staff.

LEVEL OF ATTAINMENT: Probably met.

EVIDENCE:

1. **Documentation by Project Coordinator**

The following table provides an overview of the materials training provided to teachers by project staff or consultants hired by the project.

Training Provided	Mets	Palm	Martin
LEIR Materials Training by LEIR Consultant	23	31½	
Materials Evaluation by Coordinator			4*
TOTAL DAYS TOTAL GROUP TRAINING	23	31½	4*

Extensive training occurred at the project elementary schools, but little occurred at the junior high level. The LEIR sessions were conducted by the EBEC training consultant for LEIR who was contracted by the project for this training task. See Appendix P for a complete listing of all the LEIR training that was conducted during the year.

*The secondary school teachers were involved in four materials evaluation sessions during the year. These sessions were used to locate high interest, low level materials for grades 6, 7, and 8 and to evaluate audio-visuals. In addition, representatives from several curriculum materials companies met seven times during the year with groups of secondary teachers to discuss the use of Hoffman reading machines, Scholastic books, and EBEC materials. In addition, the project coordinator met individually with several secondary teachers to discuss the use of reading materials throughout the year.

SUMMARY:

A great deal of effort appears to have gone into training the elementary teachers in the use of the reading materials used by the project. However, more training at the secondary level is perhaps indicated for next year in this area.

OBJECTIVE:

6. By the end of the project year, \$56,678 worth of reading material will be purchased and assigned to the three project schools for the classroom teachers' and reading aides' use in teaching reading as measured by inspection of AISD accounting records.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. AISD Accounting Records

As of June 30, 1974, \$48,391.49 had been paid by AISD Business Office to various firms for audiovisual, consumable, and non-consumable learning materials for students. As of June 30, a total of \$1,266.25 had been encumbered throughout the year by Project Assist for learning materials. This difference of \$6,474.76 between funds encumbered and funds paid out resulted from incomplete shipments, orders having been cancelled because they were not delivered before the end of the project year, and delivered materials having not yet been paid for by the AISD Business Office.

It was the project philosophy that no materials would be bought by the project until teachers had reviewed and recommended them for purchase. In addition, the time required for approval of purchase requisitions and orders within AISD channels after leaving the Project Assist office, according to Project Assist program staff, generally required one month. The combination of these two factors did prevent all materials monies from being encumbered early in the school year, and were probably responsible for those late orders which had to be cancelled because they had not been delivered before the end of the budget year.

Approximately \$1800 of the budgeted funds were never encumbered.

2. Aide Observation Guide

Observations indicated that significantly more audiovisual equipment and materials were found in Project Assist classrooms compared to general aide control classrooms.

SUMMARY:

The majority of available funds was spent this year. As of June 30, 1974, it appeared that \$8,300, minus the amount still to be paid out by the AISD Business Office for materials received, would be returned to the Office of Education.

OBJECTIVE:

7. The cooperating teachers at Metz, Palm, and Martin will be trained to effectively utilize the skills of the reading aides in teaching reading in their respective classrooms during monthly inservices as measured by documentation by the Project Coordinator.

LEVEL OF ATTAINMENT: Partially met.

EVIDENCE:

1. Documentation by Project Coordinator

According to Staff Development Schedules for 1973-74 (see Appendix P) there were five training sessions for teachers held exclusively on how to effectively utilize the aides in their classrooms. The first documented training sessions are recorded as February 5 for Martin teachers, February 12 for Metz teachers, and February 19 for Palm teachers. There were two other recorded teacher training sessions on using aides which were formative evaluation reports on teacher interviews held for Metz teachers on May 9, and for Palm teachers on May 30, 1974. Although not specifically recorded as aide utilization training, there were six LEIR consultant sessions in October and November, 1973. These sessions did include instruction about how to use the aides in various LEIR classroom activities.

2. Aide Interviews

During interviews at the end of the first project year, aides indicated that their teachers needed more training in the supervision, planning, and utilization of instructional aides (see Appendix N).

4. Teacher Interviews

During interviews at the end of the first project year, teachers also expressed a need for more training in how to effectively utilize aides in their classroom. Specific requests for classroom supervision by program staff for this purpose were made (see Appendix M).

SUMMARY:

It appears that some effort went into training teachers to effectively use instructional aides. However, according to aide and teacher interview responses, this training was not entirely adequate to meet this objective.

OBJECTIVE:

8. An evaluation team (1 project evaluator, 2 classroom observers) will conduct weekly conferences on the progress of the project as measured by a written statement by the project coordinator at the end of May, 1974.

LEVEL OF ATTAINMENT: Probably not met.

EVIDENCE:

1. **Documentation by Project Coordinator**

In the fall the evaluation staff and coordinator were in close contact because of the necessity of frequent trips to the experimental schools and the need to design a classroom observation guide. With the advent of a final observation guide however, the coordinator saw less of the evaluation team, depending on the completed observation guides as feedback.

Then it became obvious that the objective feedback contained in the instrument did not provide sufficient formative evaluation for the coordinator who needed subjective comments from the observers in order to discern problem areas among the aides. At this point observers attempted to correct the situation by adding such comments at the end of the observation guides, and red-tagging certain comments that they thought critical.

In January both project and evaluation personnel decided that regular weekly staff meetings might indeed improve communication. These meetings were held with written agendas, but were increasingly difficult to hold because the staff members were often simply not available to meet.

SUMMARY

Although difficult to measure, the evaluation staff feels that they have not fulfilled the objective for reasons offered above. In summary, communication between program and evaluation staff would be improved through more frequent dissemination of observation data, more frequent publication of formative evaluation reports and regularly scheduled staff meetings throughout the year.

OBJECTIVE:

9. The community will have a positive attitude toward the Project Assist philosophy, personnel, and effectiveness as measured by a parent questionnaire administered at the end of the year.

LEVEL OF ATTAINMENT: Probably met.

EVIDENCE:

1. **Parent Interviews**

Based on interviews of 102 Metz and Palm parents, their attitude toward the project philosophy, personnel, and effectiveness was quite positive (see Appendix J). Of particular interest was that parents indicated their children were more interested in reading this year than last year.

2. **ESAA Advisory Committee Questionnaire and Interviews**

In late spring, 1974, a questionnaire was administered to members of an ESAA Advisory Committee who attended one of their regularly scheduled meetings. They were asked nine questions, three concerning philosophy, three on personnel, and three on the effectiveness of Project Assist, as they viewed it. The results showed that they were highly approving of the philosophy of the project, less sure of the effectiveness of the project, and even less approving of the personnel working in the project.

Interviews were planned and initiated to assess the underlying bases for their responses. However, these interviews were not completed at the time of the publication of this report.

SUMMARY:

The evidence gathered by interviewing Metz and Palm parents indicate that, among students' parents, the project has their support and approval.

VI

INTERRELATIONSHIPS

To even address the subject of interrelationships of data reported in this document is a bit dubious, because so little of the data was adequately coded to allow for correlation analyses between measures using students as units, even if it were the appropriate unit to use. The number of schools is so small as to prohibit any correlations involving schools as units. Steps will be taken from the very beginning of the second project year to gather and code outcome and process data so that the degree of relationship between appropriate program variables may be investigated.

However, some interrelationships, if not statistically indicated, suggest themselves from the data provided in this evaluation report. Improved school attendance of students at Palm (outcome objective #3) may have been related with the possible improvement in elementary student attitude toward reading (outcome objective #2).

There appeared to be a logical relationship between the failure to attain input objective #2 ("a project staff will be hired on schedule") and failure to completely attain input objectives #3 ("the aides will receive two weeks of preservice reading instructional training"), #4 ("the aides and teachers will undergo preschool and inservice training together"), #8 ("56,678 worth of reading materials will be put into the experimental schools"), and #9 ("teachers will be trained to use the aides").

The extent to which the evaluation team did not provide continual feedback to the program staff (input objective #8) probably also affected the attainment of the training input objectives listed in the above paragraph.

VII

MISCELLANEOUS INFORMATION

"MISCELLANEOUS" DATA FOR PROGRAM REVISION

There is much "miscellaneous information" provided in the appendices to this report which do not directly relate to the stated program objectives for Project Assist. However, if thoroughly digested by program and school level personnel, this data will greatly assist in the effective revision of some program activities. Aides and teachers have candidly and willingly offered literally hundreds of observation and suggestions of the success and failure of many techniques used during the first project year. Specific attention paid to the achievement test results, at the school level and at grade levels, will point out the areas which should be emphasized in instruction during the second project year. There is much in these appendices to be encouraged about, also.

NATIONAL ESAA PILOT EVALUATION

System Development Corporation of Santa Monica, California (contractor with the U. S. Office of Education to evaluate the ESAA Pilot program) randomly selected Palm as the Austin ESAA school and Brooke as the Austin comparison school as part of its evaluation sample. Students at both schools were involved in the California Achievement Test testing (pre and post) at the intermediate grades, and in several affective measures. Teachers, especially at Palm, were quite involved in the national evaluation effort, being required to keep extensive records on their students and to complete several affective measures themselves.

Considerable effort will be made by the local ESAA Pilot Project Assist evaluation staff to coordinate the local and national evaluation efforts at these two schools next year, in order to eliminate, where possible, duplication of efforts.

RESTRICTED ESAA FUNDS

It has been observed this year that ESAA funds (the source of monies for Project Assist) are extremely restricted, considerably more so than any of the other federal monies currently available to AISD. ESAA budget guidelines are so strict as to require frequent and extensive budget revisions for relatively minor shifts in budget priorities.

The consequence of this was that the project coordinator spent between one and two months of the project year working totally on budget revisions (based on casual observation by the project evaluator). This was time lost to teachers and aides who, accordingly, complained of not seeing the project coordinator enough in the schools. Perhaps a relaxing of budgetary restrictions on future ESAA funds would benefit the projects funded by ESAA in released staff time more than the avoidance of any imagined monetary infractions wrought by such a relaxation.

APPENDIX A

INSTRUMENT REPORT

BOEHM TEST OF BASIC CONCEPTS REPORT

Date/Period of Administration: October, 1973 and January, 1974

Population: 309 Kindergarten Students at Metz, Palm,
Brooks, ~~O'Leary~~, Becker, and Dawson Schools

Data Collected By: Classroom Teachers

Data Collection Supervised by: Department of Student Development

INTRODUCTION

The Boehm Test of Basic Concepts was given to kindergarten students in all six experimental and control elementary schools in October, 1973, and in January, 1974. A more detailed description of the instrument and its administration is attached to this appendix.

The results were analyzed to yield pre, post, and gain information about each school and each group, and to compare Project Assist group results with the two control groups' results. The results of these analyses are presented in the tables attached to this appendix and in the following discussion.

RESULTS

Project Assist kindergarten students ranked lower than kindergarten students in the two control groups at the beginning of the project year (see Tables A-1 and A-2). At midyear, however, Project Assist students scored higher than general aide control schools (see Table A-2). Despite this gain statistical comparisons yielded no significant differences between Project Assist schools and the two control groups on either the fall or the mid-year scores (see Tables A-3 and A-4). Project Assist schools made an average gain from fall to midyear administrations of over 6½ points (see Table A-5). This gain was (statistically) significantly greater than the three point national average gain made by low socioeconomic children. The midyear mean for Project Assist kindergarten children was 34.26, less, but not significantly so, than the midyear mid-socioeconomic national mean of 35.3 which was the achievement objective set for project kindergarten children. The low socioeconomic midyear national mean is 28.4, considerably less than the project midyear mean.

SUMMARY

Project kindergarten students did not achieve significantly lower than the achievement objective set by the project for the first project year. Gains were significantly larger and midyear scores were significantly greater than national norms for low socioeconomic students.

Table A-1: BOEHM TEST OF BASIC CONCEPTS RESULTS FOR PRE AND POST ADMINISTRATIONS FOR PROJECT ASSIST SCHOOLS AND CONTROL SCHOOLS

Boehm Subscale	Project Assist Schools				General Aide Control Schools				No Aide Control Schools

INSTRUMENT REPORT

PRESCRIPTIVE READING INVENTORY REPORT

Date/Period of Administration: Fall, 1973 and Spring, 1974

Population: Approximately 3,000 Second -
Sixth Graders at Metz, Palm, Brooke,
Ortega, Becker, Dawson, Martin, Allan,
and Travis Heights

Data Collected By: Classroom Teachers

Data Collection Supervised By: Department of Student Development

INTRODUCTION

The Prescriptive Reading Inventory (PRI), a criterion referenced test, was given to students at grades 2-6 in the Project Assist schools and comparison schools. However, due to variations across groups in test forms given to students at grades 2, 3, 4 and 5, comparisons between groups can be made only at grade 6. There were several problems with the data which are noted in the description of the PRI and its administration, attached to this appendix. These problems are mostly with the general aide control schools' results; consequently, no comparison of the experimental with the general aide control schools was possible.

Analyses were performed on these results to ascertain pre, post and gain results for both project and comparison schools. McGraw-Hill/CTB, publisher of the PRI, was contracted to perform these analyses. Post-test means and gains, grades 2-4, at Metz and Palm were based on matched scores of students but the scores at Becker and Dawson are not. Therefore, comparisons between the experienced elementary aides and the no aide control schools are possible only at the fifth grade level.

SECOND GRADE

Pre and post scores for Metz and Palm second graders are shown in Table B-1. An asterisk indicates that a significantly larger number of students achieved the objective on the post-test than had achieved it on the pre-test. Metz second graders made significant gains on 16 of the 41 objectives and on 11 of the 22 objectives selected by Metz teachers for particular emphasis during the first project year. Palm second graders made significant gains on 12 of the 41 PRI objectives and on 7 of the 19 objectives selected by Palm teachers for special emphasis this year.

THIRD GRADE

Pre and post scores for Metz and Palm third graders are shown in Table B-2. Metz third graders made significant gain on 18 of the 42 objectives and on 10 of the 20 objectives selected by Metz teachers for special emphasis during 1973-74.

Palm third graders made significant gains on 3 objectives and on 1 of the 17 objectives selected by Palm teachers for special emphasis.

FOURTH GRADE

Pre and post scores for Project Assist fourth graders are shown in Table B-3. Metz fourth graders made significant gains on 4 of the 42 objectives and on none of the 20 objectives selected by Metz teachers for special emphasis that year.

Palm fourth graders made significant gain on 4 of the 42 PRI objectives and on 2 of the 17 objectives selected by Palm teachers for special emphasis during the year.

FIFTH GRADE

Pre and post scores for Metz and Palm fifth graders are shown in Table B-4. An average of less than four percent of Metz and Palm fifth graders made gains on the PRI objectives tested at that grade level (See Table B-4). These two schools ranked third and second respectively when compared to the two no aide control elementary schools on achievement gains made from pre to post administration of the PRI (See Table B-5).

SIXTH GRADE

At the beginning of the year Martin sixth graders ranked third (last) among the three experimental and control sixth grade schools on a pre administration of the year, however, they ranked second (see Table B-7).

An average of almost 7 percent of Martin sixth graders made gains on the PRI objectives tested at that grade level (see Table B-8). Martin sixth graders ranked first among the three experimental and control sixth grade schools on achievement gains made from pre to post administration of the PRI (see Table B-9).

SUMMARY

Based on the PRI results and the program objectives it appears that Project Assist second, third, fourth and fifth graders did not achieve as high in reading nor did they improve as much in reading as did the no aide control students.

Project Assist sixth graders at Martin Junior High, however, appeared to have ~~improved~~ moved higher on the post test than did the general aide control sixth grades (Allan Junior High), even though they scored lower on the pretest. They also showed more improvement than either the general aide control school (Allan) or the no aide control school (Fulmore).

For pre, post and gain results for the sixth grade, see Table B-10.

ADMINISTRATION AND DESCRIPTION OF THE PRESCRIPTIVE READING INVENTORY (PRI)

The four different forms of the Prescriptive Reading Inventory (PRI) were given to children in grades one through six in the experimental and control schools on a pre and post basis in October 1973 and April 1974, according to the following table:

Table B-11: SCHEDULE OF ADMINISTRATION OF THE PRESCRIPTIVE READING INVENTORY TO EXPERIMENTAL AND CONTROL SCHOOLS ACCORDING TO TEST FORM

Grade	EXPERIMENTAL		NO AIDE SCHOOLS		GENERAL AIDE SCHOOLS							
	Palm		Metz		Becker		Dawson		Brooke		Ortega	
	Pre	Post	Pre	Post	Pre	Post	Pre	Post	Pre	Post	Pre	Post
1	-	A	-	A	-	A	-	A	-	-	-	-
2	B	B	B	B	B	B	B	B	A	A	A	A
3	C	C	C	C	C	C	C	C	A, B	A, B	A, B	A, B, C
4	C	C	C	C	C	C	C	C	A, B, C	A, B, C	A, B, C	A, B, C
5	D	D	D	D	D	D	D	D	A, B, C, D	A, B, C, D	A, B, C, D	A, B, C, D

As the reader can see, with the exception of fourth and fifth grades the general aide schools (Brooke and Ortega) did not test students exclusively with the same levels of the PRI as did the other four schools. Neither did these two schools posttest the first grade. This will prevent all between-school and between-group comparisons involving the general aide control schools.

The tests were administered by classroom teachers on what appeared to be (from irregular observations by evaluation personnel) a rather inconsistent basis: some teachers administered the test to their students in three or four hours, some gave the test in two halves on the same day, some administered it in halves during two mornings, others gave the test thirty minutes a day until the children were through with it; etc. School counselors attended a 1-1/2 hour workshop on administration of the PRI for the purpose of passing the information on to the classroom teachers in their schools at a similar workshop. Some of the counselors stated to evaluation personnel during the year that the information provided them during this workshop by the test publishers was inadequate for first-time administrators of the test. To the extent that this inadequate training of counselors adversely affected the subsequent training of classroom teachers, the substandard

administrations of the PRI's in those teachers' classrooms may affect the validity of the PRI data gathered.

There were several other problems which probably affect the validity of the data gathered. The inconsistent conditions described above under which the test was given almost certainly affect the validity of the data gathered, especially when making comparisons between groups of smaller N's. Also, many teachers complained that the test was much too difficult and long and therefore frustrating for the children. This claim indicates that the validity of the data is perhaps less than it should be for valid comparisons of achievement. In an assessment of teacher attitudes at the end of the year where there were given several choices of testing situations for their children, teachers recommended that the PRI be given next year on the basis of student achievement level rather than on a grade level basis.

According to the 1973 CBS/McGraw-Hill Catalog, the Prescriptive Reading Inventory (PRI) is described as:

... a criterion-referenced test designed to help diagnose the reading behavior of individual students in relation to reading objectives present in the elementary curriculum. It defines a student's performance solely in terms of behaviorally-stated objectives he has mastered or not mastered The PRI is not intended to sample achievement of students in broad reading areas or to compare students with a normative population. The objectives upon which PRI is based are those most generally taught in today's schools'

The PRI is divided into four levels spanning the grade range of 1.5 to 6:

Red Book (Level A)	1.5 - 2.5
Green Book (Level B)	2.0 - 3.5
Blue Book (Level D)	3.0 - 4.5
Orange Book (Level D)	4.0 - 6.0

These four levels cover a total of 90 reading objectives in the areas of sound and symbol recognition, phonic analysis, structural analysis, translation, and literal, interpretive and critical comprehension. It must be noticed that it is possible that the general objectives of LEIR are not measured by the PRI.

Data Collection Supervised By: Department of Student Development

INTRODUCTION

Level four of the California Achievement Test (C.A.T.) was the evaluation instrument designated to measure the gains made by seventh and eighth graders in Project Assist and control schools. The Project Assist evaluation design planned for a pretesting in early fall, 1973, and posttesting in late spring, 1974. However, due to unforeseen problems, the fall, 1973, pretest was not carried out. Therefore, the 1973-74 midyear district administration of the C.A.T. was designated as the posttest, and the midyear district C.A.T. administration of the previous year (1972-73) was designated as the pretest. The inadequacy of this latter pre/post testing schedule is obvious: the testing period began one half year before the program began and ended a half year before the program ended.

This arrangement implies that seventh graders' midyear sixth grade scores would be their pretest score and that eighth graders' midyear seventh grade scores would be their pretest scores. However, seventh graders at the project and experimental junior highs who had attended Brooke, Zavala, Blackshear, or Ortega Elementary Schools as sixth graders took the C.A.T. in early fall, 1972, rather than in January, 1973. This means that for these Communications Skills students the interim between Project Assist "pre" and "post" administrations of the C.A.T. was 1½ school years, not one school year. Therefore, all analyses involving "pre" C.A.T. scores of seventh graders must produce separate results for students who attended Communication Skills schools and for those who did not. Gain scores based on matched pre and post scores are reported for both groups. However, since the pre/post interim for Communication Skills seventh graders was 1½ years, and a one year pre/post interim is required by the program objective, only seventh graders gains will be used to assess the attainment of the achievement objective.

The 1973-74 eighth graders' C.A.T. reading scores were obtained from magnetic tapes originally compiled through joint efforts of AISD Department of Student Development and the AISD Computation Center. Approximately \$1,000 was spent in data processing and consultant costs to merge the 1972-73 and the 1973-74 tapes so that gain scores for junior high students could be computed to ascertain the attainment of Project Assist program achievement objectives. Analyses conducted from these merged tapes, by the Office of Evaluation, yielded quite different pretest means for eighth graders at Allan Junior High than had been computed from the original C.A.T. test data by the Department of Student Development. An extensive examination of the merged tape revealed several errors in the tape. However, these errors, when corrected did not account for the discrepancy between AISD Department of Student Development pretest means and Office of Evaluation pretest means.

A further investigation into the source of the difference between the two offices' analyses was prohibited by time. Therefore, no analyses involving Allan eighth graders' pretest scores will be reported here. The effort to resolve the discrepancy will be continued. When this is done, a supplemental report on achievement on the C.A.T. will be published.

SEVENTH GRADE RESULTS

Table C-1 shows pre and post means and gain statistics for the three experimental and control groups of seventh graders. Pretest scores (for non Communications Skills students, column 2 on Table C-1) for the three schools indicate that sixth graders who eventually attended Fulmore scored highest (5.77), Martin scored second highest (5.54), and more than one grade level lower was Allan at 4.48. Posttest scores showed Fulmore seventh graders reading at 6.55 grade level, Martin seventh graders at 5.48, and Allan seventh graders at 4.80.

The only significant differences found among these three schools on either the pre or the post measure was on the posttest between Fulmore and Martin, (See Table C-9) and on the posttest between Fulmore and Allan, both differences in favor of Fulmore students.

Average gains were computed from pre to post administrations of the C.A.T. for seventh graders, based on matched pre and post scores for non Communications Skills students (for whom there was approximately a one year interval between pre and post scores). The average gain for Martin seventh graders was .33 years, for Allan students .61 years, and for Fulmore students .81 years (See Table C-1). Fulmore seventh graders gained significantly more than did Martin students (See Table C-10).

EIGHTH GRADE RESULTS

Table C-12 shows pre and post means and gain statistics for the three experimental and control eighth graders (with the exception of those statistics which would have involved Allan eighth graders' pretest scores while they were seventh graders; see paragraph four in the introduction to this appendix).

Pretest scores indicate that Martin students in the middle of their seventh grade were reading at the 5.07 grade level, and Fulmore students were reading at the 6.32 grade level. This was a significant difference (See Table C-13).

On the posttest, Fulmore eighth graders scored significantly higher than Martin eighth graders at the middle of the year (See Table C-14). Martin eighth graders were reading at the 5.61 grade level, and Fulmore students were reading at the 7.27 grade level. Fulmore eighth grade students also gained significantly more in reading (.79 years) from pre to post than Martin eighth graders did (.59 years).

INSTRUMENT REPORT

PUPIL ATTENDANCE REPORT

Date/Period of Administration: Data gathered throughout 1973-74

Population: All students in Austin Independent School District

Data Collected by: Classroom teachers and school office personnel

Data Collection Supervised by: Department of Pupil Services

INTRODUCTION

Every year the A.I.S.D. Department of Pupil Accounting prepares a yearly report listing the percent of student attendance for each school in the district. This percentage is determined by dividing the Average Daily Attendance (ADA) of a school by the Average Daily Membership (ADM) of that school. The resulting percentages are rounded off to the nearest percent in the yearly reports.

RESULTS

From the A.I.S.D. attendance reports for 1972-73 and 1973-74 (see Table D-2), attendance data on the experimental and control schools was gathered, and differences were calculated (see the following table):

TABLE D-1: PERCENT OF AVERAGE DAILY ATTENDANCE FOR EXPERIMENTAL AND CONTROL SCHOOLS FOR YEARS 1972-1973 AND 1973-1974

SCHOOLS	% ADA 1972-1973	% ADA 1973-1974	DIFFERENCE
<u>PROJECT ASSIST SCHOOLS</u>			
PALM	88	89	+1
METZ	92	91	-1
MARTIN	82	81	-1
<u>GENERAL AIDE CONTROL SCHOOLS</u>			
BROOKE	92	91	-1
ORTEGA	93	91	-2
ALLAN	85	85	SAME
<u>NO AIDE CONTROL SCHOOLS</u>			
DAWSON	94	93	-1
BECKER	91	89	-2
TRAVIS HEIGHTS		91	NO DATA FOR PREVIOUS YEAR
FULMORE	90	89	-1

Of particular note is the fact that Palm Elementary, one of the two elementary Project Assist schools, was the only Austin elementary school out of 52 elementary schools (grades K-5) to improve its attendance this year. Attendance at Metz Elementary and Martin Junior High attendance both decreased one percent.

It should be pointed out that there was an overall decrease in attendance throughout the entire school district, with attendance going down from 92 percent during 1972-73 to 91 percent in 1973-74. Of the 52 elementary schools, 11 retained the same percent of attendance, 30 decreased in attendance, and one school increased (Palm). Junior high schools averaged an attendance loss of one percent, and the high schools averaged a loss of over 2 1/2 percent. These decreases in attendance are probably reflective of a national trend of school attendance decreases.

TABLE D-2: AUSTIN PUBLIC SCHOOLS PERCENT OF AVERAGE DAILY ATTENDANCE BY SCHOOLS FOR 1973-1974 COMPARED WITH 1972-1973.

INSTRUMENT REPORT

PIERS-HARRIS CHILDREN'S SELF CONCEPT SCALE REPORT

Date/Period of Administration: October 1973 and April 1974

Population: 933 Third and Fourth Graders at Metz,
Palm, Brooke, Ortega, Dawson, and
Becker

Data collected by: Classroom Teacher

Data Collection Supervised by: Department of Student Development

INTRODUCTION

The Piers-Harris Self Concept Scale was administered in the fall of 1973 and the spring of 1974 to all third and fourth grade students in the Project Assist elementary schools (Metz and Palm), the general aide control elementary schools (Brooke and Ortega), and the no aide control elementary schools (Dawson and Becker).

Analyses were performed to ascertain whether there were significant changes in self concept from pre to post within each group, and to determine whether there were significant differences in self concept between groups. The following discussion and tables present the findings of these analyses.

COMPARISON OF PROJECT ASSIST AND GENERAL AIDE CONTROL SCHOOLS

There was a significant loss on the total Piers-Harris scores of both Project Assist and general aide control third grade students, (see Table E-1). However, there was no significant change from pre, to post for fourth grade students for either groups.

There was no significant difference between Project Assist and general aide control third graders on total Piers-Harris scores on either pre or post measures (see Table E-2). However, there was a significant difference at the fourth grade level between the two groups on both pre and post measures in favor of the control fourth grade students.

COMPARISON OF PROJECT ASSIST AND NO AIDE CONTROL SCHOOLS

There was a significant loss on the total Piers-Harris scores of both Project Assist and no aide control third graders (see Table E-1). For fourth graders, no change was seen for Project Assist students, but a significant gain was made by no aide control students.

There was no significant difference between Project Assist and no aide control third graders on total Piers-Harris scores on either pre or post measures (see Table E-3). At the fourth grade level, there was a significant difference on the pre measure in favor of Project Assist students, but it had disappeared by the end of the year owing to the gains made by the no aide control students.

SUMMARY

At the third grade level, there were no differences between Project Assist students and either of the two control groups on either pre or post test measures of the Piers-Harris. Significant losses in self-concept were made by all three groups of third grade students.

At the fourth grade level, general aide students began the year with a significantly higher self concept than the Project Assist students, and maintained that edge throughout the year. The Project Assist fourth graders had a significantly higher self concept at the beginning of the year, but had lost that advantage by the end of the year due to a greater gain by the control group. No significant change in self concept was made by Project Assist or general aide control fourth graders. However, a significant gain was seen for the no aide control fourth graders.

Tables E-4 through E-13 give more detailed results on individual schools and grades than are found in Tables E-1 through E-3. Program and school personnel may find these latter tables beneficial.

Table E-1: SUMMARY OF SIGNIFICANT GAINS ON PIERS-HARRIS FROM FALL, '73 TO SPRING '74 IN PROJECT ASSIST SCHOOLS, GENERAL AIDE CONTROL SCHOOLS, AND NO-AIDE CONTROL SCHOOLS

ADMINISTRATION AND DESCRIPTION OF PIERS-HARRIS CHILDREN'S SELF-CONCEPT SCALE

The test was administered in November 1973 and April 1974 to children in all classes of grades three-five at the experimental and control elementary schools. It was administered by classroom teachers in their respective rooms.

The test manual describes the instrument as follows:

The Piers-Harris Children's Self-Concept Scale is also called "The Way I Feel About Myself." It is composed of simple declarative statements, e.g. "I am a happy person" and at least half were negative in content, e.g. "I behave badly at home." Children were asked whether they liked or disliked themselves in the following categories: Behavior, Intellectual and School Status, Physical Appearance and Attributes, Anxiety, Popularity, and Happiness and Satisfaction.¹

The instrument was developed by Ellen V. Piers and Dale B. Harris and it is standardized. Copies of the instrument are on file in the A.I.S.D. Office of Evaluation.

¹Excerpt from: Piers, Ellen V. Manual for The Piers-Harris Children's Self-Concept Scale (The Way I Feel About Myself). Counselor Recordings and Tests: Nashville, Tennessee. 1969.

APPENDIX F

INSTRUMENT REPORT

ELEMENTARY READING ATTITUDINAL TEST REPORT

Date/Period of Administration: Late Spring, 1974

Population: 763 Students in Grades K-5 at Palm, Metz, Brooke, Ortega, Becker and Dawson Schools

Data Collected By: Classroom Teachers, Counselors, University of Texas Students, and Office of Evaluation Staff

Data Collection Supervised by: Office of Evaluation

INTRODUCTION

The elementary Reading Attitudinal Test was administered to one class from each grade level (K-5) at each of the six elementary experimental and control schools in late spring of the first project year. A more detailed narrative of the administration and description of the instrument is found at the end of this appendix.

Tests were scored and means for each grade level at each school were computed on the four subscales and the total score. Statistical comparisons between the experimental group and each of the two control groups by means of a simple t-test, and significance levels were computed. All these statistics appear in the two tables attached to this appendix. The following sections discuss these results.

EXPERIMENTAL VERSUS GENERAL AIDE CONTROL GROUP

Of the 35 comparisons made between Metz and Palm versus Brooke and Ortega, only two were found to be significant (see Table F-1). There was no significant difference on total scores between the two groups at any grade level or between the total populations of the two groups.

EXPERIMENTAL VERSUS NO AIDE CONTROL GROUP

Metz and Palm first graders had a significantly more positive attitude toward reading than did Becker and Dawson first graders as measured by this instrument. No significant difference was found at any of the other grades, although the difference at fourth grade was close to the significant level in favor of Metz and Palm. When the total populations of the two groups were compared, the difference (in favor of Metz and Palm) was almost significant ($p=.0575$) (see Table F-2).

SUMMARY

At the end of the first project year, there appeared to be no significant difference between the experimental and general aide control group on attitude toward reading. However, the difference between the experimental and no aide control schools in favor of the experimental group was very nearly significant.

ADMINISTRATION AND DESCRIPTION OF THE READING ATTITUDE TEST FOR ELEMENTARY STUDENTS.

For the administration of this test, one class was selected from each grade level of the elementary experimental and control schools, including Kindergarten. Administration usually took place in school classrooms. Classes were selected from a list of teachers names using a table of random numbers. Each teacher received a cover letter and directions on each test question. The test was given only on a post test basis only. In most cases the teachers administered the test, but at one experimental school it was given by the counselor, and at two no-side control schools the test was given by college students and observers from another program.

The test is a set of 32 paired pictures which covers four portions of a beginning reader's day and includes activities that are representative of academic and free time tasks at school, as well as common after-school and pre-bedtime activities. Each page shows children engaged in two different activities, and the child must only mark the activity that he prefers. There is a separate form for boys and girls.

Drs. Sam Weintraub of Indiana University and Nancy Reeser of the University of Texas were co-authors of the test. Extensive field testing for standardization was conducted in at least three sites: Houston, San Antonio, and in Indiana.

Copies of this instrument are on file in the Office of Evaluation.

APPENDIX G

INSTRUMENT REPORT

SECONDARY READING ATTITUDINAL TEST REPORT

Date/Period of Administration: Late Spring, 1974

Population: 741 Sixth, Seventh, and Eighth Graders at
Martin, Allan, Travis Heights, and Fulmore
Schools

Data Collected By: Classroom Teachers and Evaluation Staff

Data Collection Supervised By: Office of Evaluation

INTRODUCTION

The Secondary Reading Attitudinal Test was given in late spring of the first project year to four classes per grade level at each of the secondary experimental and control schools (grades 6, 7, 8) to a total of 36 classes in order to measure student attitude toward reading. A more detailed narrative of the administration and description of this instrument is found at the end of this appendix.

Tests were scored and means for each school and for each grade level at each school were computed on the three subscales and the total score. Statistical comparisons between the experimental group and each of the two control groups were made by means of a simple t-test, and significance levels were computed. All these statistics appear in the two tables attached to this appendix. The following sections discuss these results.

EXPERIMENTAL VERSUS GENERAL AIDE CONTROL SCHOOL

The general aide control sixth graders (Allan) had a significantly higher attitude toward reading as measured by this instrument than the experimental sixth graders (Martin). There was no significant difference between Martin and Allan seventh graders or eighth graders. When the total populations of the two schools were compared, no significant difference in attitude toward reading was found (see Table G-1).

EXPERIMENTAL VERSUS NO AIDE CONTROL SCHOOLS

There was no significant difference in attitude toward reading between the experimental sixth graders (Martin) and the no-aide control sixth graders (Travis Heights). However, the difference between Martin and Fulmore seventh graders was almost significant, in favor of the Fulmore students, and the Fulmore eighth graders did score significantly higher than the Martin eighth graders on this measure. When the total populations of the two groups were compared (Martin versus Travis Heights and Fulmore), the control group was found to have a significantly higher attitude toward reading.

SUMMARY

It appears that, generally speaking, there was no difference in attitude toward reading between the experimental and general aide control schools at the end of the first project year on this measure. However, the no aide control students scored significantly higher on the same administration of an attitude toward reading instrument than did the experimental students.

ADMINISTRATION AND DESCRIPTION OF SECONDARY READING ATTITUDINAL TEST (R.A.T.)

The Secondary Reading Attitudinal Test (R.A.T.) was administered to four classes per grade level at each of the secondary experimental and control schools to a total of 36 classes. In three of the four schools tested, homogeneous class grouping by achievement was the norm; at each grade level at those three schools the test was administered to one "low" class, two "average" classes, and one "high" class. In the fourth school, class grouping was heterogeneous, and the test was administered to four randomly selected classes. The test was administered in early May 1974, on a post-test-only basis by classroom teachers, except, once again, at the fourth school where the project evaluator administered the tests.

At the three schools where classroom teachers administered the tests, the teachers were prepared for this by verbal instructions from the project evaluator through a contact reading teacher on each campus.

Admittedly scores in the fourth school (a no-side control school) could have been affected because of its uniqueness on both the class grouping variable and the test administrator variable. In those three schools where homogeneous class grouping was in effect, another possible problem concerns the two forms of the test: Form A of the test was always given to the "low" class in each grade level, and Form B was always given to the "high" class. To the extent that the items on Forms A and B are not equivalent, and to the extent that low-achieving and high-achieving students would react to the items on these two forms differently, some intraschool between class comparisons might be affected. This situation, however, if true, would not affect any interschool comparisons of similar groups.

The instrument is a forced-choice test. Form A contains 28 items and Form B contains 27 items. In each form fourteen items contrast a reading activity with a non-reading activity. The test is divided into three sections: school activities, after-school activities, and before-bedtime activities. The rationale for the instrument is that the more times a person selects a reading activity over a non-reading activity, the higher that person's "attitude toward reading" is. The instrument was developed by project evaluation staff. The test has not been standardized as of this writing. Neither has its validity or reliability been determined. Work in this area is planned for the summer of 1974. Copies of the two forms of this instrument are attached to this report.

INSTRUMENT REPORT

AIDE OBSERVATION GUIDE REPORT

Date/Period of Administration: January - May, 1974

Population: 42 Classroom Aides at Palm, Metz,
Martin, Brooke, Ortega, and Allen

Data Collected by: Project Assist Classroom Observers

Data Collection Supervised by: Office of Evaluation

INTRODUCTION

The Aide Observation Guide (A.O.G.) was devised as a form to be used by classroom observers in reporting the observations of Project Assist aides and untrained general control aides on certain aide activities and aspects of the classroom environment in which they worked. The primary purpose of these observations was to document the ways in which Project Assist aides and general control aides spent their time, and the activities in which they were involved, and the strategies they use. At the end of this appendix is a more complete guide on the administration and description of this instrument.

The A.O.G. was composed of four main subscales. All items on the four subscales were rated by observers on a 5-point Likert-type scale from "Never Observed" (1) to "Always Observed" (5). The four A.O.G. subscales are described briefly below:

1. Aide Instructional Activities Subscale

These eleven items describe various instructional activities in which instructional aides might be involved, e.g., "drills students in word and sentence structures."

2. Aide Instructional Strategies Subscale

The nine items in this subscale describe instructional strategies an aide might use during instruction, e.g., "asks questions students readily understand."

3. Aide Non-instructional Activities Subscale

The twelve items on this subscale describe the various ways in which an aide could be employed in a non-instructional capacity, e.g., "makes display materials."

4. Classroom Environment Subscale

The five items on this subscale center not only on the aide but on the teacher and students as well, and describe the relationships observable among these classroom personnel, as well as observable student interest in instruction.

In addition to the above four subscales, the following information is also available from individual items on the A.O.G.:

- Where the aide was observed
- Number of children aide worked with
- Percent of time aide worked on instructional tasks
- Percent of time aide worked on non-instructional tasks
- Percent of time aide worked on reading tasks
- Number of adults instructing in the classroom.

There are additional A.O.G. items which measure the variety of materials present in the room and their use by students, aides, teachers.

DATA ANALYSIS

Several comparisons were possible on any of the aforementioned subscales and items:

Between Project Assist schools (Metz, Palm and Martin) and general aide control schools (Brooke, Ortega, and Allan).

Between secondary experimental (Martin) and secondary general aide control (Allan) schools.

Between elementary experimental (Metz and Palm) and elementary general aide control (Brooke and Ortega) schools.

These comparisons were made, as well as other smaller-scale comparisons which were suggested by the data.

A simple t-test was used for comparing the two groups. When assessing the significance of differences among several groups, F-tests were computed. Only means, N's, and probability levels are included in the following tables. However, other central tendency measures are available on file in the AISD Office of Evaluation.

Results of these analyses are shown in the tables attached to this appendix and in the following discussion.

COMPARISON OF ELEMENTARY EXPERIMENTAL SCHOOLS AND ELEMENTARY GENERAL AIDE CONTROL SCHOOLS

The Project Assist aides in the elementary experimental schools were rated significantly higher as a group than the aides in general aide control schools on two A.O.G. subscales: Aide Instructional Activities and Aide Instructional Strategies (see Table H-1). This means that elementary Project Assist aides as a group were involved in significantly more instructional activities and used significantly more instructional strategies than did the general classroom aides at Brooke and Ortega as a group.

It is of interest that Metz and Brooke did not differ significantly on these two scales, however. Nor did they differ on the percent of time aides spent on instructional and non-instructional tasks (see Table H-2). Except for a higher-rated classroom environment, Brooke was no different from an experimental school on the process criteria as measured by the Aide Observation Guide.

There was no significant difference observed between Project Assist aides and general classroom aides on the Aide Non-instructional Activities Subscale (see Table H-1). This implies that as a group, elementary Project Assist aides spent as much time in non-instructional activities throughout the day as did the general classroom aides, even though the Project Assist aides were involved in significantly more instructional activities.

On the Classroom Environment Subscale, however, the general aide control schools (Brooke and Ortega) rated significantly higher than did the Project Assist experimental schools (Metz and Palm) (see Table H-1). Additional analyses were conducted to further examine this difference. The Classroom Environment Subscale contains ratings on the observability of the following five items:

- Mutual respect among students.
- Mutual respect between teacher and aide.
- Mutual respect between aide and students.
- Mutual respect between teacher and students.
- Student interest in instruction.

Comparisons between the Project Assist schools and general aide schools on each of these items revealed significant differences in favor of the control schools on three items: mutual respect among students, mutual respect between teacher and aide, and mutual respect between teacher and students (see Table H-1). It appears from these observations that the above three qualities are significantly higher at Brooke and Ortega than at Metz and Palm. It is probably not appropriate at this point to discuss the factors contributing to this classroom environment difference. It is not certain whether this difference is a function of some other variable(s) than Project Assist. However, this difference in classroom environment should be remembered when examining the data relating to outcome objectives for these two groups.

Another significant difference found between the two groups of elementary schools involved the number of adults instructing in the classroom. Brooke and Ortega averaged 0.37 more adults instructing per classroom than was found at Metz and Palm (see Table H-1). When one looks at the school averages on this item (Table H-9), one finds that Brooke (a general aide control school) had an average of 11.29 more adults instructing in classrooms at any given time of the day than did the Project Assist schools as a group. Ortega (the other control school) had an average of 2.78 more adults instructing in the classroom at any given time than did the Project Assist schools. This difference is undoubtedly due to two University of Texas-based reading projects operating at Brooke and Ortega. The project

at Brooke was headed by Dr. Frank Guszak and provided as many as 80 part-time University of Texas students per semester to tutor and otherwise instruct students in reading. Dr. Nancy Roser headed another reading training program for undergraduate students at Ortega which involved fewer students who worked less extensively in the classroom than did the university students in the Brooke program. Neither of these two programs was in existence at the time of the designation of Brooke and Ortega as control schools, nor was it anticipated that the two programs would be placed there.

When the two experimental and control groups were compared on the presence and use of educational materials in their classrooms (see Table H-3), the following significant differences were found:

- . Significantly more audiovisual equipment and materials were present in experimental classrooms.
- . Significantly more instructional aids like flashcards, reading games, puzzles, teacher and aide-made instructional materials were present in experimental classrooms.
- . Significantly more student stories and books were used by students and aides in experimental classrooms.
- . Significantly more student art was used by teachers in experimental classrooms.

COMPARISON OF SECONDARY EXPERIMENTAL JUNIOR HIGH AND SECONDARY GENERAL AIDE CONTROL SCHOOL

Martin was rated significantly higher than Allan on all four A.O.G. subscales beyond the .001 level of probability (see Table H-4). This means that the Martin aides were involved in significantly more instructional activities, used significantly more instructional strategies, and performed significantly fewer non-instructional activities than did the aides at Allan Junior High. In addition, the classroom environments in which Martin aides worked were rated significantly higher than were the classroom environments in which Allan aides worked (see Table H-4).

Observations also revealed a significant difference in favor of Martin for percent of time aides spent on instructional tasks and for percent of time aides spent on reading activities. Allan aides spent a significantly greater amount of time on non-instructional tasks (see Table H-4).

COMPARISON OF ALL EXPERIMENTAL SCHOOLS WITH ALL GENERAL AIDE CONTROL SCHOOLS

The aides in the experimental and control schools did not differ significantly on the number of children they worked with (see Table H-5). The two groups did differ significantly in favor of the experimental group on: (1) percent of time aides spent on instructional tasks, and (2) percent of time aide spent on reading activities. The control group aides rated significantly higher on percent of time aide spent on non-instructional tasks.

Corresponding differences were found on the A.O.G. subscales. Project Assist aides were rated significantly higher on the Aide Instructional Activities Subscale and on the Aide Instructional Strategies Subscale. Control general aides were rated significantly higher on the Non-instructional Activities Subscale. When comparing all the experimental classrooms and all the general aide control classrooms in which observations were made, there was no difference found between the two groups on the Classroom Environment Subscale.

When using both secondary and elementary schools for the comparison, there was no difference on number of adults instructing in the classrooms between the experimental and control groups.

When the two groups of aides were compared on where they were working when the observation occurred (see Graph H-6), the experimental aides were found to work:

- . more in classrooms than did control aides.
- . more in reading labs than did control aides.
- . less in workrooms than did control aides.
- . less in offices than did control aides.
- . more in hallways (tutoring) than did control aides.

School percentages for this measure are found in Table H-7.

When Martin, Metz, and Palm were compared with each other on A.O.G. Subscale ratings, no difference among the three experimental schools was found on any of them (see Table H-8).

Program and school personnel may be interested in reviewing the school and group means for each of the items on the A.O.G. This information is found in Table H-9, the last table in this appendix.

* The difference between the two groups is statistically significant.

** Capital letters refer to subscales, and smaller letters refer to individual items.

¹ Mean = average score on an item

² N = number of observations done in those schools

³ Probability level: anything below .05 is considered here to be significant beyond the realms of chance. For example, a probability level of .05 means the odds are only 5 chances out of 100 that an observed difference is due to chance alone.

Table H-2: COMPARISON OF BROOKE AND METZ ELEMENTARY SCHOOLS ON VARIOUS ITEMS AND SUBSCALES OF THE AIDE OBSERVATION GUIDE

Item/SUBSCALE	GROUP	MEAN ¹	N ²	PROBABILITY LEVEL ³
Number of children aide worked with	Brooke	6.5200	25	.573
	Metz	5.4286	21

¹Mean = average score on an item or a subscale

²N = number of observations done in those schools

³Probability Level = anything below .050 is considered here to be significant beyond the realm of chance. For example, a probability level of .050 means the odds are only 5 chances out of 100 that an observed difference is due to chance alone. The smaller the probability level (.040, .010, .001, etc.) the more sure you may be that the observed difference is indeed a real difference and not just a fluke of chance.

* The difference between the two groups is statistically significant.

ADMINISTRATION AND DESCRIPTION OF AIDE OBSERVATION GUIDE

An Aide Observation Guide (AOG) was used to observe the aides at the three control schools in the spring and at the three experimental schools both fall and spring. The observers used the guide for 35-45 minutes, observing the aides during all school periods. There were 230 observations done in the fall and 206 in the spring. Observations were scheduled so that all aides would be observed an equal number of times (except due to absences). When an aide was tutoring outside the regular classroom, the observation took place as usual.

The two observers practiced together using the observation guide in the first six weeks of the school year, once observing videotaped sequences and 15-20 times in the classroom. Various members of the A.I.S.D. Office of Evaluation discussed techniques with the observers, and the coordinator and the evaluator of the program both used the instrument several times during the year.

Validity of the data may have been affected by the aides' uneasiness during observations. It became clear that observers could not sit too near the aide without bothering her and the students. Even at the end of the year several aides commented during interviews that they were still ill at ease during observation. Some children may have acted considerably different toward the aides during observation, but probably only during the first observations. The reliability of the instrument may have been affected by the use of two observers with different backgrounds. This problem can be cured by practice in observation and close comparison of results.

Rationale for the instrument comes from the growing importance of observation as a method of educational evaluation, and from particular studies that have shown the effectiveness of observation. For example, in a paper presented at the annual meeting of the American Educational Research Association last year, A. J. Palmo (1973) showed that an observation checklist produced valid evaluation data while a checklist filled out by teachers did not. The same year Charters and Jones (1973) report that only the use of classroom observations revealed that the "experimental" and "control" staffs at different schools were not really different at all.

The first version of the observation guide was developed by modifying Ben M. Harris' and Kenneth E. McIntyre's Comprehensive Observation Guide (1964). In the first semester the evaluation staff met frequently with the project coordinator to discuss and further adapt the instrument to their needs. During this time the instrument underwent many varied changes. These revisions eventually resulted in a satisfactory instrument including a time line of aides' and teachers' activities, a checklist of teaching materials and their use, and several 1-5 Likert scales rating frequency of certain aide activities. However, these revisions also rendered the data gathered first semester, via the approximately six

different preliminary instruments, unanalyzable as a whole. This first semester observation data was used nonetheless by the project coordinator for formative feedback. Only the data gathered second semesters was analyzed and is reported in this document. No standardization of the instrument was attempted. The final instrument used second semester is attached to this appendix.

Aide Observation Guide

Aide _____ School _____
Teacher _____ Date _____
(Length of Observation) From _____ To _____

1. Where did you observe the aide? Classroom Reading Lab Workroom
Other _____ Hallway Office Between classes
2. Number of children Aide worked with during observation _____
3. Percentage of time Aide worked on instructional tasks _____
4. Percentage of time Aide worked on non-instructional tasks _____
5. Percentage of time Aide worked on reading-related tasks _____

General Comments:

On the following page make a time line; by drawing horizontal arrows in the spaces which correspond to the activities with which the aide and teacher work. Also record the number of students the aide and teacher work with throughout the observation period. Any number in parentheses () defines students who worked with the aide or teacher previously during this observation period.

APPENDIX I

INSTRUMENT REPORT

TEACHER FALL AND SPRING QUESTIONNAIRE REPORT

Date/Period of Administration: October, 1973, and April, 1974.

Population: 140 professional staff members at Palm, Mats, Martin, Brooks, Ortega, and Allan Schools.

Data Collected by: Evaluation staff and school counselors.

Data Collection Supervised by: Office of Evaluation

INTRODUCTION

Questionnaires were completed by the teachers at all ESAA and Title I schools. Administration took place in November, 1973, and again in April, 1974. Teachers read the self-contained instructions and completed the forms at their own convenience. During the fall, Office of Evaluation staff distributed and collected the forms. During the spring, counselors at each school distributed and collected the forms.

Besides the Project Assist questions, the instrument contained questions concerning the various Title I programs, plus the Bilingual/Bicultural ESAA program. The spring questionnaire was issued only to Title I and ESAA schools. The fall questionnaire asks for the teachers' opinions of the aides' training, attitude, and effectiveness in instructional work. The spring questionnaire retained the same questions and added certain questions addressed only to teachers at Project Assist experimental schools. The additional questions concerned administration of the program and recommendations for next year. The questions were designed with two process objectives in mind:

1. Teachers will have a favorable attitude toward the use of aides as instructional reading aides.
2. Teachers will effectively use aides in reading activities.

The items were developed by Office of Evaluation staff. Questions were answered on a 5 point Likert-type scale, or by a simple yes-no response. No standardization of the instrument was possible, nor was there any way to check the instrument's validity. However, the teachers' anonymity may have encouraged them to be truthful.

FALL TEACHER QUESTIONNAIRE

Included on the fall teacher questionnaire were 13 questions about the classroom aides. Statistical comparisons (t-tests) were conducted to assess any differences between the following groups:

1. All Project Assist schools vs. all general aide control schools.
2. Project Assist junior high school vs. general aide control junior high school.
3. Project Assist elementary schools vs. general aide control elementary schools.

Project Assist classroom teachers appeared overall to have a more positive attitude about their aides' training, performance, and effects than did teachers in the general aide control schools (see Table I-1). Significant differences in favor of Project Assist teachers' responses were found on the following items: (see next page)

59. The aide(s) in my classroom cares about the students and their learning progress.
63. The aide(s) in my classroom assists me effectively in the diagnosis of student reading problems.
68. The aide(s) in my classroom has helped improve the reading skills of my students.

A comparison between junior high Project Assist teachers' and control teachers' responses also indicated an overall more positive attitude (see Table I-2) and yielded significant differences in favor of the Project Assist teachers' responses on items 59 and 63 (see above).

Comparisons between elementary Project Assist teachers and elementary control teachers yielded no significant differences, although most differences were in favor of the Project Assist teacher responses (see Table I-3).

Also included on the fall teacher questionnaire were three questions concerning the administration and implementation of Project Assist. The responses indicate that teachers at Palm, Metz, Martin, and Allan felt quite sure that they understood what Project Assist was all about (see Table I-4). However, they did not feel that the people employed by Project Assist had adequately assisted them in implementing the program in their classes. They agreed somewhat that materials supplied by Project Assist had been adequate to meet the needs of implementing the program.

SPRING TEACHER QUESTIONNAIRE

Included on the spring teacher questionnaire were the same 13 questions about classroom aides contained in the fall questionnaire plus an additional question. Statistical comparisons (t-tests) were conducted to assess any differences between the following groups:

1. All Project Assist schools vs. all general aide control schools.
2. Project Assist junior high school vs. general aide control junior high school.
3. Project Assist elementary schools vs. general aide control elementary schools.

Except for a few items, there appeared to be little difference between the experimental and control teachers' responses on the fourteen items relating to aides' training, performance, and effects (see Table I-5). Significant differences in favor of Project Assist teacher responses were found on the following two items (see next page):

48. The aide(s) in my classroom assists me effectively in the diagnosis of student reading problems.
53. The aide(s) in my classroom has helped improve the reading skills of my students.

A comparison between the junior high Project Assist teachers' and control teachers' responses indicated pretty much the same responses for both groups (see Table I-6) except for the following two items which favored the Project Assist teachers:

51. If the aide(s) was taken out of my classroom, the students would learn less.
53. The aide(s) in my classroom has helped improve the reading skills of my students.

Comparisons between elementary Project Assist teachers' and elementary control teachers' responses yielded no significant differences (see Table I-7) except for the following item which favored the general aide control schools:

55. The aide(s) in my classroom has increased communications with parents.

Some additional questions were asked of teachers at the Project Assist schools (see Table I-8). These questions concerned their perceptions of the administration and implementation of Project Assist, and requested teacher input for next year's program. Table I-11 contains individual school means for most of these items.

CHANGE IN TEACHER ATTITUDE TOWARD AIDES FROM FALL 73 TO SPRING 74

In the fall elementary Project Assist teachers rated their instructional aides higher on ten of the thirteen aide items than the elementary control teachers rated their general aides (see Table I-9). However, in the spring the elementary Project Assist aides were rated higher than the general aides on only seven of the thirteen items.

The attitude changes among both elementary Project Assist teachers and control teachers from pre to post were actually quite slight. Because teacher responses were anonymous, significance tests could not be performed to examine the significance of any changes from fall to spring.

The greatest change among elementary teachers was on the item, "If the aide(s) were taken out of my classroom, the students would learn less," and was in the negative direction for both Project Assist teachers and control teachers.

The lowest-rated items on both fall and spring questionnaires were:

The aide(s) in my classroom assists me effectively in the diagnosis of student reading problems.

The aide(s) in my classroom has increased communications with parents.

The highest-rated items both fall and spring by both elementary groups were:

The students respond positively to the aide.

If the aide(s) were taken out of my classroom, the students would receive less individual instruction and attention.

On the fall teacher questionnaire, the junior high Project Assist teachers rated their aides higher on ten of the thirteen items than the control teachers rated their general aides (see Table I-10). However, on the spring questionnaire, the Project Assist aides were rated higher than general aides on only seven of the thirteen items.

The attitude change among junior high teachers from pre to post was negligible for some items and large for other items. The greatest change among junior high teachers was on the following two items:

The students in my classroom respond positively to the aide(s).

When the aide(s) in my classroom works alone helping students, I feel sure he/she is doing a good job.

The change for these two items was positive for both junior high Project Assist teachers and for control teachers.

The lowest-rated items on both fall and spring were:

The aide(s) in my classroom assists me effectively in the diagnosis of student reading problems.

The aide(s) in my classroom has increased communication with parents.

The highest-rated item both fall and spring by both junior high groups was: The aide(s) in my classroom cares about the students and their learning progress.

I-18

ADMINISTRATION AND DESCRIPTION OF TEACHER INTERVIEW FORM

This instrument was given to all classroom teachers at Metz, Palm, and Martin in whose classes Project Assist Aides worked. The interviews were conducted in midspring, 1974, by Office of Evaluation staff. Interviewers were evaluators, classroom observers, data specialists, or evaluation interns, all of whom had either extensive interviewing experience or who had received training before going out to interview.

The instrument consists of thirteen questions, most of them open-ended, concerning the effects of Project Assist in their classrooms. The instrument was developed to yield information to the project coordinator for planning the next year's program and to provide evidence for certain current program objectives. The interview was designed to elicit the frank and open comments from teachers which it was felt a mailout questionnaire might not have elicited. The instrument was developed by Project Assist evaluation staff with some input from the project coordinator. The instrument was not standardized nor validated in any formal way. However it was felt by the staff after using the instrument that most teachers answered the questions frankly and forthrightly. In an informal assessment approximately 95% of the teachers interviewed said that they would rather be interviewed than fill out a questionnaire.

A P P E N D I X J
INSTRUMENT REPORT
PARENT INTERVIEW REPORT

Date/Period of Administration: April and May, 1974

Population: 102 parents of students at Metz and Palm

Administered by: Four ESAA Bilingual/Bicultural community representatives at Metz and Palm

Administration Supervised by: Office of Evaluation

INTRODUCTION

A ten percent random sample of parents of children at Metz and Palm was taken. From this sample interviews were conducted by community representatives from these schools. Parents were asked questions regarding Project Assist aides, the reading curriculum used in Metz and Palm, and their children's reading progress. A more complete description of the instrument used in its administration is found attached to this report.

OVERALL RESULTS

The results of these interviews are given in the following two tables. The overall results seem to indicate that parents at Metz and Palm approve of Project Assist reading aides being in their children's school and feel that they are doing a good job.

They react favorably toward the idea of children learning to read by writing stories about their own experiences and ideas (a L.E.I.R. technique), and indicated that their children had indeed brought home stories that they had written in school this year.

Metz and Palm parents tended to feel that their children read better this year than last year, and that their children are more interested in reading this year than last year. However, they are somewhat less certain that their children read as well as they should be reading.

COMPARISON OF METZ AND PALM PARENTS

Mothers at Metz and Palm and fathers at Metz and Palm were compared on their responses to each of the seven interview questions (see Table J-1). The only significant difference found between both the mothers and the fathers at the two schools was that Metz parents feel significantly stronger than Palm parents that their children are more interested in reading this year than last.

No significant differences were found between Metz and Palm parents on any of the other interview questions, although there were nonsignificant differences on most of the other questions in favor of Metz parents.

Parents responses were broken down by grade level, and are portrayed in Table J-2 attached to this report. However, so few responses are found in some of the groups as to make statistical analysis of the questionable value. Consequently, these analyses were not performed.

Table J-1: COMPARISON OF PARENT INTERVIEW RESULTS FOR METZ VS. PALM

ADMINISTRATION AND DESCRIPTION OF PARENT INTERVIEW INSTRUMENT

The Project Assist parent interview was administered in early May 1974 to a sample of ten percent of the parents of students who attended Metz and Palm who were chosen by random numbers. The interviews were conducted house-to-house by ESAA community-diaison personnel at Palm and Metz schools. They visited homes on weekdays during and after working hours, calling parents first for their convenience. Sampling error may have occurred since not all parents sampled were available or willing to be interviewed.

In all cases the interviewer read the questions aloud to the parent(s), then marked his or her responses on the interview form. Therefore, the interviewers met prior to the interviews with the evaluation staff for a discussion of interview techniques and an explanation of each interview question. Ways of paraphrasing the more difficult questions were discussed as well as correct interpretation of parents' answers. Since each question was written in both English and Spanish, there was also a discussion of language or "code" switching.

The instrument consists of seven questions concerning the parents' opinions of the concept and work of the Project Assist reading aides, the elementary reading program, and the progress of their children in reading. The instrument was developed by the project evaluation staff to determine the attitude of the community toward the project. Both mothers' and fathers' responses were solicited; the sex of the parent responding is indicated on the form. A copy of this instrument is attached to this report.

In addition to the bilingual program, there is another project at your child's school this year called Project Assist. Project Assist is a reading program which puts teacher aides in the classrooms who help the teacher teach reading to children. These aides were trained in teaching reading before school started. The school feels that this extra help in the classroom allows students to receive more individual instruction from an adult and will help students.

Además del programa bilingüe, en este año hay otro programa en la escuela de su niño. Se llama Project Assist. En este programa los asistentes ayudan a las maestras enseñarles a leer a los estudiantes. Los asistentes recibieron entrenamiento en como enseñarles a leer a los alumnos. Con los asistentes, esperamos que cada estudiante recibe más instrucción por adultos.

1. Do you feel it is a good idea to have these aides in your child's school?

¿Cree ud. que un asistente debe ayudarle a la maestra?

INSTRUMENT REPORT

STUDENT INTERVIEW REPORT

Date/Period of Administration: March and April, 1974

Population: 267 elementary and junior high students
at Metz, Palm, Martin, Brooks, Ortega,
and Allan schools

Data Collected by: Project Assist Classroom Observers

Data Collection Supervised by: Office of Evaluation

INTRODUCTION

Students were interviewed at each of the Project Assist schools (Metz, Palm, and Martin) and at the general aide control schools (Brooks, Ortega, and Allan). Only students from grades 3, 5, 6, 7, and 8 were included in this survey. The purpose of the interview was to assess the attitudes of students toward the use of aides as instructional personnel. Interviewers were the two classroom observers involved in the evaluation of Project Assist and two additional young adults who volunteered to help with the interviews. A more complete description of the instrument used and its administration is found attached to this report.

Statistical comparisons (t-tests) were made on the student interview data for the following groups:

1. All Project Assist schools vs. all general aide control schools
2. Project Assist junior high school vs. general aide control junior high.
3. Project Assist elementary schools vs. general aide control elementary schools
4. Metz Elementary vs. Palm Elementary (both Project Assist schools).

The results of these comparisons are found in the four tables attached to this report, and are discussed below.

RESULTS

Students at both the experimental schools and at the general aide control schools indicated a rather positive attitude toward the aide as an instructional person. The only significant difference found between all Project Assist students interviewed and all control students interviewed was that Project Assist students were more likely to seek out their aides for help in reading than were the control students (see Table K-1). This could be interpreted that students search out more help from reading instructional aides than from non-instructional aides.

There were no significant differences found between students at the experimental junior high (Martin) and the general aide control junior high (Allan) on this measure (see Table K-2).

The greatest differences in student attitudes toward their aides were observed when comparing the elementary Project Assist students with the elementary control students (see Table K-3). Control students had a stronger desire to have both an aide and a teacher in the classroom than did the Project Assist students. However, elementary Project Assist students indicated a greater willingness to ask assistance in reading

from their aides than did the control students. Similarly, when given a choice, the experimental students showed a greater willingness to choose the aide to help them reading than did the control students.

As a final analysis, Metz and Palm students' responses were compared, and some differences were found (see Table K-4). Palm students indicated that they are more likely to go to the aide for assistance in reading than are Metz students. Likewise, Palm students also indicated that if given a choice they were more likely to choose the aide to teach them reading than were the Metz students. The total scores on student interviews indicate a difference in favor of Palm students, although the difference did not quite reach the required level of significance.

ADMINISTRATION AND DESCRIPTION OF STUDENT INTERVIEW INSTRUMENT

The Project Assist student interview was given to students at Metz, Palm, and Martin Junior High, and to an equal number of students at Brooke, Ortega, and Allan Junior High. At the junior highs, students at all grade levels (6, 7 & 8) were interviewed; only third and fifth graders were interviewed at the elementary schools. At each school fifteen students were interviewed individually at each of these grade levels.

Observers from the project evaluation staff administered the instrument in mid-spring, 1974. Students were chosen by random numbers from the rolls of each school. Teachers were advised of the need to interview students and cooperated by excusing them for 15-20 minutes from class. The interviews always took place in the nearest quiet place where students would not be overheard, often in a corner of the school library. No special training was used, but the observers practiced the interview with several students as a "trial run" before interviewing the study subjects.

Problems with the interview administration were frequent but not critical. Students were often absent or had changed classes. In these cases more students were randomly selected. Sometimes teachers were testing or were otherwise unwilling to release their students. This caused some delays but no serious problems.

The instrument was a series of 18 questions developed by the Project Assist coordinator and evaluation staff. Some items were designed to help the student feel talkative and at ease, others to camouflage the critical questions on teacher aides and reading. The remaining six key questions which were the only ones to be coded for data analysis concerned the students' opinions of teacher aides.

The interview was designed specifically to measure student opinion in light of the following process objective: "Students will have a favorable attitude toward the use of aides as instructional reading aides." A copy of this instrument is attached to this report.

INSTRUMENT REPORT

AIDE QUESTIONNAIRE REPORT

Date/Period of Administration: October, 1974

Population: Project Assist aides at Palm, Metz, Martin
and Allan Schools

Data Collected By: Office of Evaluation Staff

Data Collection Supervised By: Office of Evaluation

INTRODUCTION

A questionnaire was administered to aides at the Project Assist schools in October, 1973. This questionnaire was designed to measure the degree of cooperation and acceptance aides had found among the regular school staff. A more detailed narrative of the administration and description of this instrument is found at the end of this appendix. The aide responses are described below.

RESULTS

Metz Project Assist aides had a more positive response to almost all the items than did the other aides at Metz (ESAA Bilingual/Bicultural aides, Title I aides, AISD aides) (see Table L-1).

There was little difference between Palm Project Assist aides and other Palm aides to the questionnaire items. Palm aide responses to item #7 indicate that at the beginning of the year (October) Palm teachers did not understand what Project Assist aides were capable of doing as well as they understood what the other Palm aides capabilities were (see Table L-2).

It was possible to compare Martin aides with Allan aides (see Table L-3). On almost all items the Project Assist reading aides (Martin) gave more positive responses than did the untrained general aides (Allan). Martin Project Assist aides were not compared to other Martin aides, because there were so few other aides at that school.

SUMMARY

At the beginning of the first project year, Project Assist aides reacted positively to questions about the cooperation and acceptance extended them by their respective school staffs. It would appear that trained reading aides felt more accepted by teachers than did untrained general aides.

Table L-1: METZ AIDES' RESPONSES TO AIDE QUESTIONNAIRE ITEMS, OCTOBER, 1973

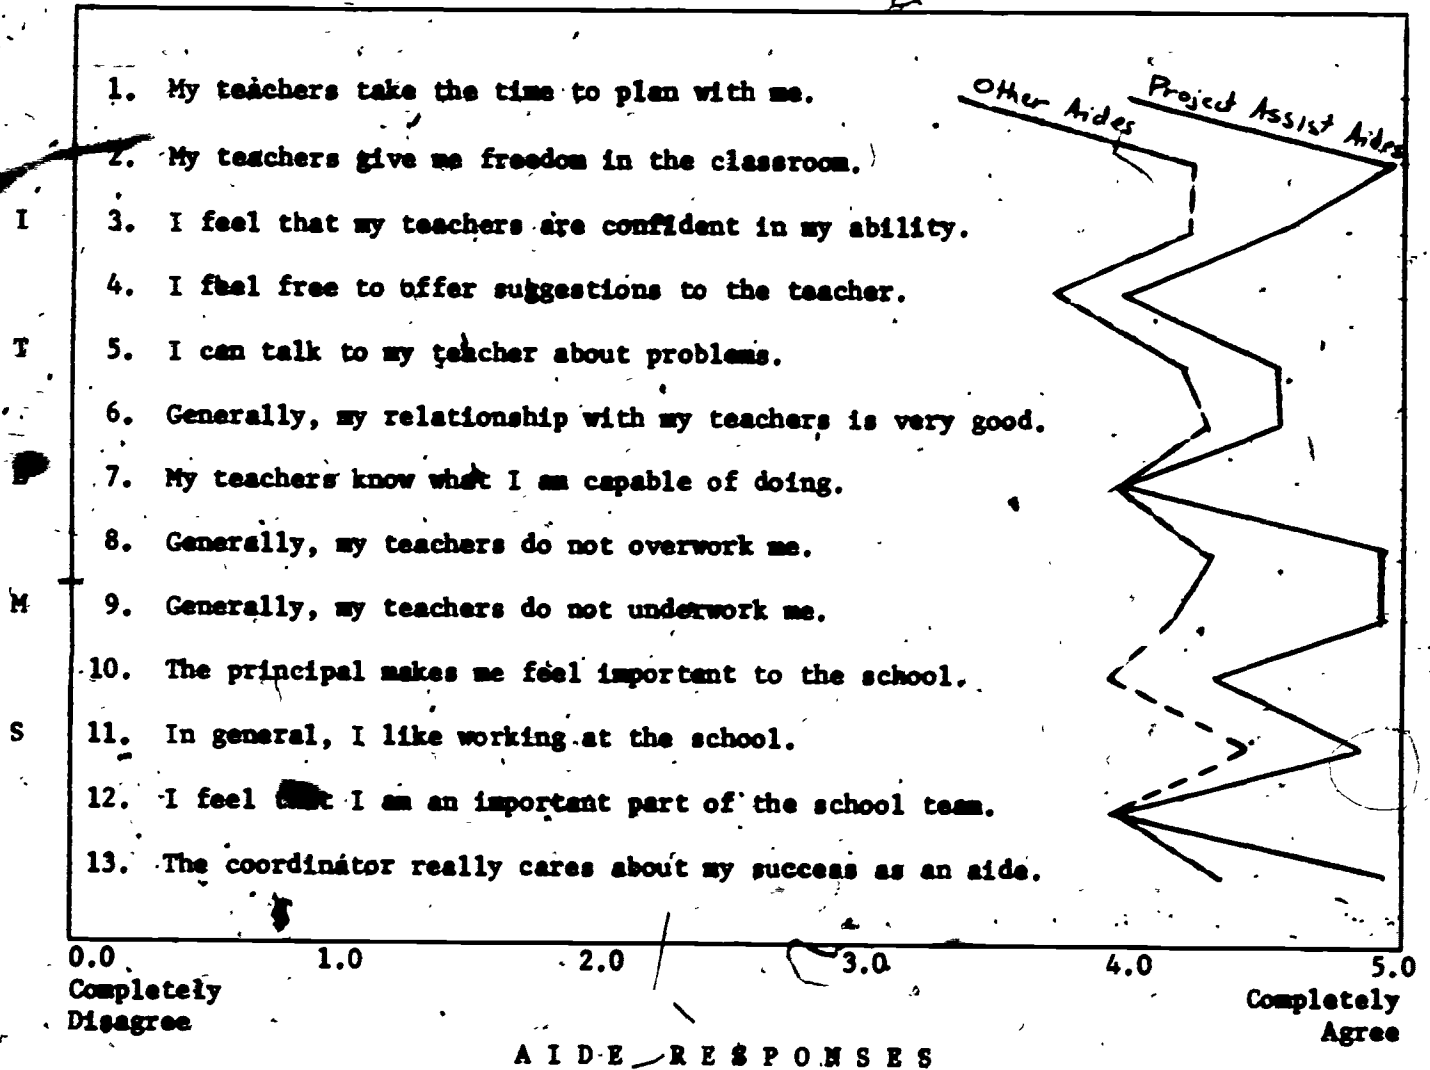

Table L-2: PALM AIDES' RESPONSES TO AIDE QUESTIONNAIRE ITEMS, OCTOBER, 1973

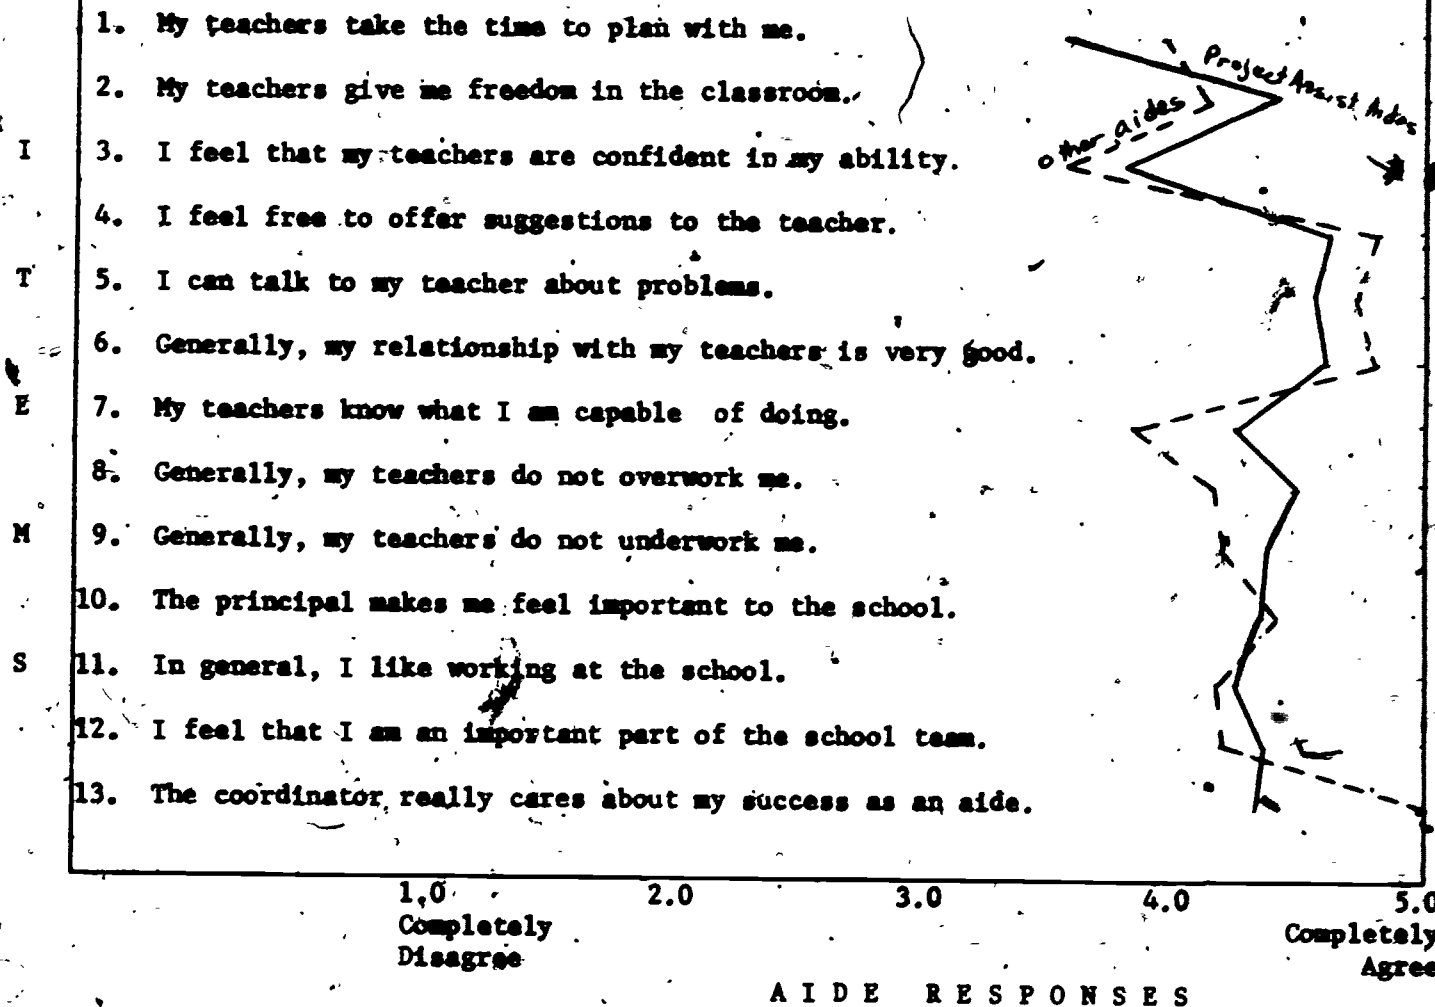

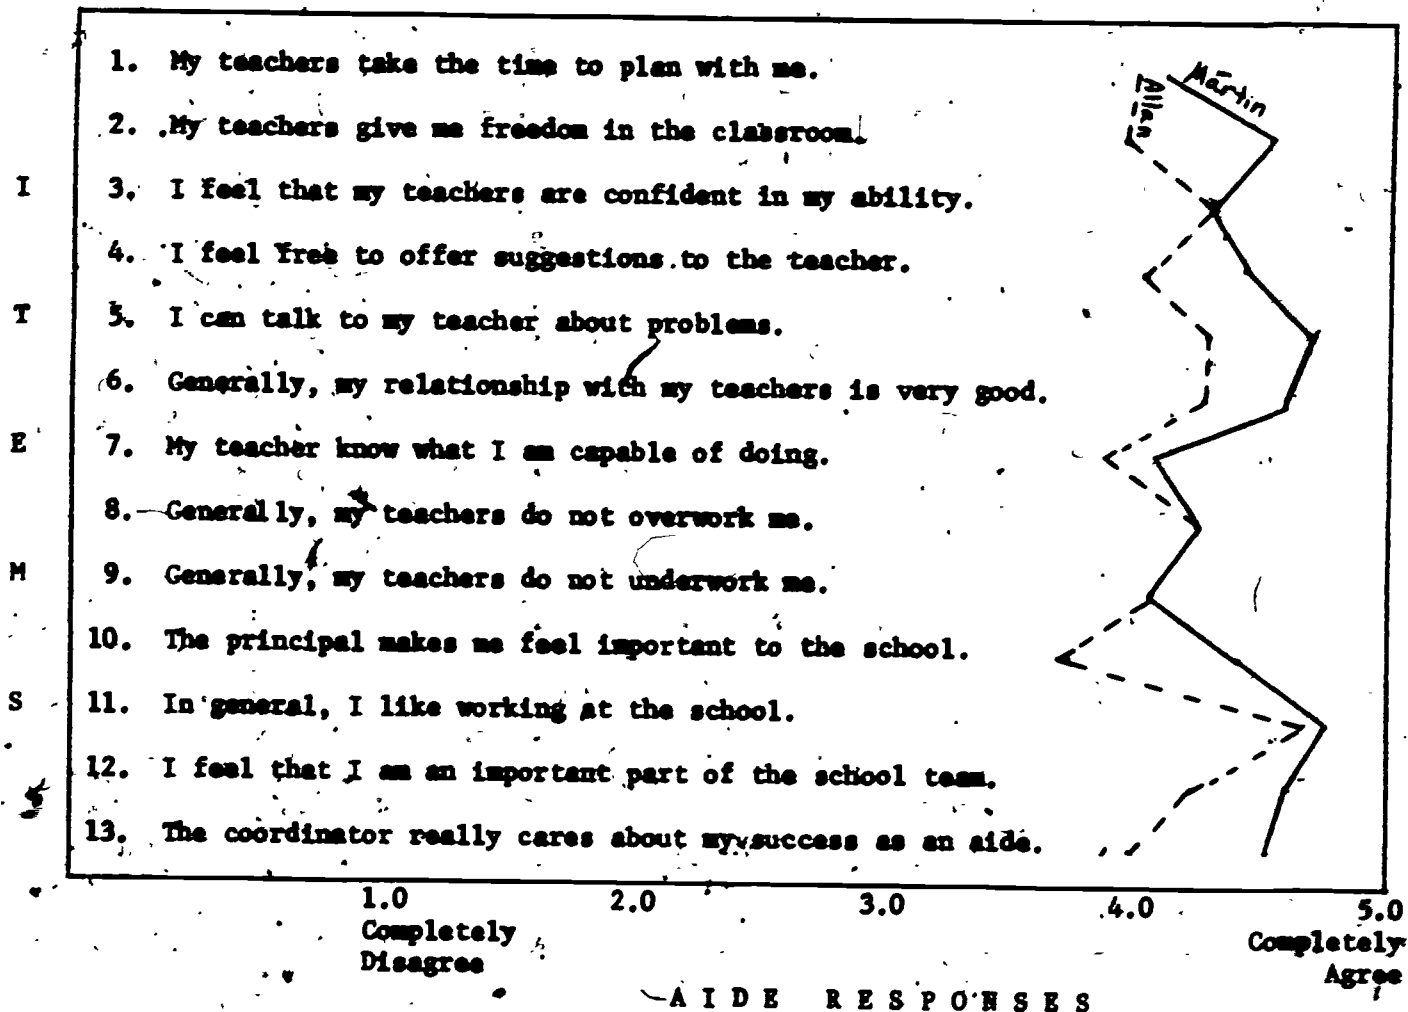

Table L-3: MARTIN AIDES' RESPONSES VERSUS ALLAN AIDES' RESPONSES TO AIDE

QUESTIONNAIRE ITEMS, OCTOBER, 1973

ADMINISTRATION AND DESCRIPTION OF AIDE QUESTIONNAIRE FORM

The Aide Questionnaire was given to all reading and general aides at experimental and control schools. The questionnaire was delivered to the schools by the project evaluation staff in October 1973. The aides completed the forms on their own time.

There was one problem which could have affected the validity of the data. There was a very low return from two of the experimental schools (8 returns out of a possible 14). This situation was due to the procedures used by the project evaluation staff to retrieve the completed questionnaires.

The questionnaire consisted of thirteen questions concerned with the aides' feelings about their work, their school, the teachers they worked with, and the project coordinator. They were asked to rate their feelings on a 1 - 5 scale (1 = definitely disagree 5 = definitely agree).

The questionnaire was developed by the Office of Evaluation staff with input from the coordinator. It was designed to obtain formative evaluation information for the coordinator.

The questionnaire was not standardized.

APPENDIX M

INSTRUMENT REPORT

TEACHER INTERVIEW REPORT

Date/Period of Administration: Mid Spring, 1974

Population: All Teachers Who Worked With Project
Assist Aides at Metz, Palm, and Martin

Data Collected By: Evaluation Staff

Data Collection Supervised By: Office of Evaluation

INTRODUCTION

All teachers at Metz, Palm and all Martin teachers who worked with Project Assist aides were interviewed in midspring, 1974, toward the close of the first project year by evaluation staff. The purpose of these interviews was to determine teacher reactions to the program and to elicit their suggestions for improving the project during its second year. Their reactions were summarized by school and published in three ESAA Project Assist Formative Evaluation Reports -- 2A, 2B, and 2C. The reader is referred to these reports for more detailed responses to the interview questions.

The following sections attempt to briefly describe teacher responses to questions asked during the interviews, and will point out any trends noted in teacher attitudes concerning Project Assist.

WHAT PERCENT OF SCHOOL TIME EACH DAY DOES YOUR PROJECT ASSIST AIDE SPEND ON: (VARIOUS ACTIVITIES)?

Teacher responses are noted below by school:

<u>Metz</u>	<u>Palm</u>	<u>Martin</u>	
58.89	77.24	66.9	a. Reinforcing and/or tutoring small groups or individuals.
19.38	14.41	14.0	b. Instruction supervision of large or total groups.
7.55	4.41	1.8	c. Making materials for instruction.
6.61	1.76	1.2	d. Making materials for display.
7.05	4.06	7.8	e. Clerical duties (grading, dittoing).
2.50	0.88	7.0	f. Other.

THIS YEAR MY PROJECT ASSIST AIDE HAS BEEN THE MOST HELP TO ME BY:

Teachers at all three project schools said that "individualizing instruction" was the greatest assistance provided by Project Assist aides. Other frequently volunteered responses were: making materials, clerical duties, reinforcing skills, making decisions, taking over for teacher sometimes, and reducing the pupil/teacher ratio.

DO YOU FEEL YOUR PROJECT ASSIST AIDE HAS BEEN EFFECTIVE AS AN INSTRUCTIONAL READING AIDE?

Teacher response to this question was very positive -- Metz teachers averaged 4.70 on this scale, Palm 4.41, and Martin 4.42. From these responses, it could be concluded that instructional reading aides were accepted by their teachers as classroom instructional personnel.

WHAT HAS BEEN THE GREATEST PROBLEM(S) WITH YOUR PROJECT ASSIST READING AIDE?

Teachers noted they had experienced problems with their aides in the following areas: absence and tardiness, not having the aide long enough, low reading levels of some aides, inadequate aide training in reading instruction, and not enough planning time with the aide.

WHAT HAS BEEN YOUR GREATEST DIFFICULTY IN ADJUSTING TO WORKING WITH AN INSTRUCTIONAL AIDE?

Teachers stated they had experienced the following difficulties in adjusting to working with an instructional aide: simply adjusting to another instructional person in the classroom, planning for the aide and finding time for this, and grouping for instruction by two persons.

DO YOU FEEL THAT YOUR STUDENTS THIS YEAR HAVE SHOWN A GREATER INTEREST IN READING THAN YOUR STUDENTS DID LAST YEAR?

Project teachers were not sure whether their students' interest in reading had increased this year. Metz teachers' average rating was 3.2, Palm 3.14, and Martin 3.4. Martin teachers thought their students' reading interest had improved more than did Metz and Palm teachers.

WOULD YOU LIKE TO HAVE A PROJECT ASSIST AIDE IN YOUR CLASSROOM NEXT YEAR?

No. of responses	50	1	4
	Yes	No	Undecided

The great majority of project teachers want to have a Project Assist aide in their room again next year. Of the 55 teachers who were interviewed, 91% answered yes to this question. The only "no" response indicated she already had an aide, and one was enough.

NEXT YEAR I WOULD LIKE TO SEE MY PROJECT ASSIST AIDE TRAINED BEFORE SCHOOL STARTS TO DO THE FOLLOWING THINGS:

Teacher responses are recorded by grade level in each of the three teacher interview formative reports. Generally, teachers indicated that all the topics covered in the first year's aide training program were appropriate, and made the following suggestions for additional topics: how to manage time and work faster, classroom and discipline management, lesson planning, and human relations techniques.

WHAT ADDITIONAL MATERIALS DO YOU NEED IN YOUR CLASSROOM NEXT YEAR THAT PROJECT ASSIST MIGHT SUPPLY YOU WITH? (THIS IS NOT A PROMISE, JUST A SURVEY)

Teacher requests for materials are recorded by teacher name and grade level in each of the three teacher interview formative reports. Frequent requests from elementary teachers were consumable items, visual aids, and books for students to read. Junior high teachers requested periodicals, audiovisual equipment and materials, and workbooks. Teachers at all three schools indicated that more of the same kind of materials supplied during the first project year would be welcome. Project staff responsible for supplying these materials are directed to read the formative reports for more specific direction in selecting materials.

WHAT HAS BEEN THE MOST BENEFICIAL EFFECT OF PROJECT ASSIST IN YOUR CLASSROOM?

Teachers indicated that individualized instruction was the greatest benefit of Project Assist. Other benefits mentioned were materials, new reading curriculum, bilingual community aides for students to identify with, and relief and assistance for the teacher in the form of aides.

WHAT HAS BEEN YOUR BIGGEST DISAPPOINTMENT WITH PROJECT ASSIST?

Teachers indicated that inadequate ~~screening~~ ^{screening}, aide schedule problems, inconvenient inservice and meeting times, inadequate teacher training, aide absenteeism, and inadequate program administration and coordination at school levels were disappointments to teachers during the first project year.

DO YOU HAVE ANY OTHER COMMENTS ABOUT PROJECT ASSIST WHICH YOU WOULD LIKE TO MAKE?

About an equal number of positive comments and suggestions were made. Suggestions focused on screening, hiring, and assignment of new aides,

side training, teacher training, reading curriculum used in project schools, materials, and program administration. The positive comments were general expressions of appreciation for the program and a belief that the program had had a beneficial effect during its first year.

SUMMARY

Program and school personnel are strongly urged to review the three formative reports which report teacher responses to these interview questions in much greater detail. There is much "miscellaneous" information in these reports which would be very helpful to persons responsible for staff development, materials selection, supervision, and administration of Project Assist.

The table on the following page summarizes teacher opinion concerning the attainment of several of the program objectives.

Table M-1: SUMMARY OF TEACHER OPINION CONCERNING THE ATTAINMENT OF SEVERAL PROJECT ASSIST PROGRAM OBJECTIVES

OBJECTIVE	EVIDENCE
Improved student interest in reading	Project teachers feel this is probably not happening. They feel that this year's students have about the same interest in reading as their students had last year (see page M-2 of this appendix). Teacher perceptions indicate that this objective was probably not met.
Aides will each work at least 90% of school classtime in reading activities.	Project teachers perceive that Project Assist aides are spending at least 90% of school time in direct instructional contact with students (see page M-1 of this appendix). Teacher perceptions indicate that this objective is being met.
Teachers will have a favorable attitude toward use of aides as instructional reading aides.	Project teachers feel quite strongly that their Project Assist aides have done a good job as instructional aides (see page M-2 of this appendix). Teacher perceptions indicate that this objective is being met.
Teachers will effectively use aides in reading activities.	Project teachers perceive that the Project Assist aides have been most useful by helping to individualize reading instruction (see pages M-1 and M-3). Assuming that "individualizing instruction" is an effective use of aides, teachers perceive that this objective is being met.

APPENDIX N

INSTRUMENT REPORT

AIDE INTERVIEW REPORT

Date/Period of Administration: - Late Spring, 1974

Population: All Project Assist Aides at Palm,
Metz, and Martin

Data Collected By: Evaluation Staff

Data Collection Supervised By: Office of Evaluation

INTRODUCTION

The aide interviews were conducted by Project Assist evaluation staff in May, 1974. Twenty of the 23 Project Assist aides were interviewed on 27 questions. Each of those questions and the aides' responses are found in this appendix, reported by school. No analyses other than simple tallies were done on these responses.

Program and school personnel are strongly urged to study this appendix in detail. Many cogent points are made by the aides in these interviews. Their observations and suggestions to contribute to an even stronger, more successful project year.

1. What grade level(s) do you teach?

<u>Palm</u>		<u>Metz</u>		<u>Martin</u>	
Grade	#Aides	Grade	#Aides	Grade	#Aides
K.	1	K	1	6th	4
1st	1	1st	1	7th	8
2nd	1	2nd	1	8th	5
3rd	1	3rd	1	(Martin aides work with more than one grade level)	
4th	1	4th	1		
5th	1	5th	1		

2. With how many teachers do you work?

Palm	2.66 teachers/aide
Metz	3.30 teachers/aide
Martin	2.9 teachers/aide

3. How many years experience as an aide have you had before this year?

Palm	.6 years experience
Metz	0 years experience
Martin	.6 years experience

4. What percentage of each day do you spend in:

<u>Palm</u>	<u>Metz</u>	<u>Martin</u>	
56.83%	43.33%	69.22%	a. Reinforcing and/or tutoring small groups or individuals.
22.59%	24.17%	18.00%	b. Instructional supervision of large or total groups.
6.50%	10.00%	2.67%	c. Making materials for instruction.
5.83%	10.83%	1.22%	d. Making materials for display.
7.00%	11.67%	8.89%	e. Clerical duties (grading, dittoing).
1.33%	—	—	f. Other.

5. Have you seen any improvement in children's reading this year that you could attribute to your work?

Palm

No

Uncertain

III 1
Yes

What work have you done with them that you feel made the difference?

Individual attention that kids couldn't receive in classroom; aide used a wide range of word attack skills and general reading techniques; most important was individual regular attention.

Giving them individual attention. Often children came to aide to get explanation of things couldn't understand.

Aide did better with one student only; three maximum for effective work. Own materials (made by aide) were noticeably more effective.

Playing reading games made a lot of difference, reading from a reader was good when done with individual help. Lots of patience helped. Work outside the room was often necessary. Some work wasted in crowded classroom.

Consonant and vowel practice in English, and the same in Spanish.

Phonetic practice with kids including initial and final sounds.

Metz

1
No

1
Uncertain

III
Yes

What work have you done with them that you feel made the difference?

Aide has used the sounding-out of words, especially focusing on vowels; results felt in spelling as well as reading. Kids needed much confidence; gotten by being told repeatedly that they're doing well.

Too new to judge.

This aide is not responsible for school reading instruction.

Helping them sound out words, reviewing words, listening to them read.

Individual work and repetition, many questions.

Martin

No

Uncertain

THH 1111

Yes

What work have you done with them that you feel made the difference?

Aide makes sure that kids do their work. Largely because of effective disciplinary tactics, often with free time as a reward for work.

Working with flash cards, Dolch words; used dictionary a lot. Just reading books and stories. Having a 6th grade reading lab helps.

Explaining to them to make their own time (individualizing instruction). Using soft music helped some students to work.

Working in small groups has helped. Working closely with children. Having them re-do their work until it's correct.

Mostly discipline work with them. Then they have gotten down to work. They must learn to follow instructions before they can work.

Encouraged independent learning.

Speaking Spanish with them, translating for them. I just got out of school (am 19 years old myself); some other aides have forgotten how to do some of the stuff.

The individualized approach (small groups, two instructional people) has helped. My being Mexican-American did help, because I could approach them and I knew them. I think they had fun learning when they were with me.

Working with them in small groups is better for them. They will all get involved. If I use Controlled Reader as a game, they get involved a lot more. I give points and have rules. They respect this system. Teachers and students like this approach. Have even used money for prizes occasionally. This game approach works best with lower levels. Even shy students will find themselves enthusiastic about it.

6. What training do you think a Project Assist aide working at your grade level needs?

Palm

Thorough reading techniques, training with teachers so aides and teachers understand, and so reading terms are common between aide and teacher (avoids misunderstanding). Diagnostic skills very important.

Phonetic skills, motivating skills, training with games as in this year's game workshops.

Half 1st-grade kids haven't ever been to school. Many are afraid, don't see teacher figure as helper, but punisher, at least until you get to know them. Aide should know how to do this. Next, aide should know how to test them, find out what they know.

Phonics should be emphasized; how and where to get materials; how to plan with teachers - and the teachers need that training too.

Training in giving individual instruction in English and Spanish, specifically with consonants, vowels, and diphthong inventories. Also, how to use games, not just making them. LEIR books were not explained by levels. The LEIR levels for each book were explained incorrectly.

Explain work in more detail, notably LEIR program (for which aides were supposed to get a notebook that they never got).

Metz

Mostly in the major reading skills and techniques; (materials need to be introduced). Show aide step by step how to introduce the vowels, what rules to use, and what rules to tell or not to tell the kids.

G.E.D. training seems to be sufficient.

Difficult question- spend time with teacher in general preparation.

More practice on phonetics and sounds.

Not sure - something in language area, including punctuation.

Start from beginning. Learn how to get along with kids, express yourself, and be liked by them.

Martin

How to use a grade book, check roll, how to cope with an assignment in the case of absence of a teacher.

More training in all kinds of reading and English materials. Also parts of speech (adverbs, adjectives, etc.).

Whatever field (English is mine) the aide is assigned to, she should be given training in. I could have used more training this year in pronouncing words and spelling.

Long and short vowels, etc.

All the things we've had this year.

Don't know.

How to run the reading lab machines. Need to become familiar with all the materials we will use in school. We need to practice reading and talking to a group to overcome our shyness if possible before school starts.

Lot of training in disciplinary action. Prepositional phrases, diagraphs, folklore, and mythology (needed a refresher in these throughout the year).

Need more training in discipline. At first it was real bad. Need training to not be shy speaking in front of the class. Need help in pronouncing words (word attack skills), especially with on-grade level kids. (use videotape)

7. What kinds of in-service and training have you found most helpful this year?

Palm

Not very helpful for this aide - too elementary. Some things that were good: rhymes, diagraphs, nomenclature.

Initial conferences in what to expect generally, a little training in sounding out words (phonetics), making of games.

Discipline training and reinforcement, also how to help children with emotional and learning problems.

Children really enjoyed and aides really utilized their reading games; training in testing was very much needed.

Basic English phonetic skills - short and long vowels.
Training repetitions and diphthong training insufficient.

Notebook for use with the newspapers was effective.

Metz

Some tapes for rhyming and one LEIR workshop with feet-drawing and story-writing was good.

None given.

Workshops with dramatization, orchestration, portrayal, etc., and art work.

Planning what to do with kids each day (before school started). Sometimes teachers helped a little.

Has had no inservice or training.

No training.

Martin

Didn't get any training at all when hired.

All of it was a lot of help.

Pre-school training (pronunciation, vowels, etc.) at Kealing was helpful.

Phonics in-service.

Service Center (Region XIII) training by Margaret Miller was helpful.

Don't know.

Confrontation skills, "you own the problem" types of training was helpful.

Reading inventories, readability level formulas, games workshops, pre-school training in general was good.

Classes on phonics, suffixes were very helpful (consonants, vowels, syllables, etc.). Wish we could have more training in this. Maybe even the same thing again as a reminder.

8. What kinds of in-service has not been provided that you would liked to have had?

Palm

Not too much - but needed some with teacher and the aide.

Not sure except general fifth grade skills.

How to treat kids with emotional problems. Basic reading skills needed to be covered; how to test and assess kids abilities.

More training as to what to do in kindergarten. This aide was told both that she could and could not teach kids a certain skill at kindergarten level.

Training in the use of machines like language-masters (using them effectively instead of just making them function).

LEIR should be explained in more detail. More explanation on other materials than LEIR, for example on the filmstrips.

Metz

Workshops that concentrate on teaching skills to children rather than art, or workshops that deal only with materials making. Aide had no training when first employed in the reading skills she needed most.

Didn't think about it, or think it necessary.

How to handle kids outside playing games during recess and how to handle them physically. (Kindergarten aide needs this).

More phonetics, ditto machine (?), disciplinary inservice!!!

How to get along psychologically vis-a-vis discipline.

Some general training before got started - any areas needing training with planning component.

Martin

Don't know.

Nothing.

None.

None.

More disciplinary techniques would have helped. I think practical experience helps this.

Don't know.

Get-together of all Project Assist aides much more frequently to discuss problems and solutions and to share information.

Discipline areas. Refreshers throughout the year in reading technology. Need much more training in confrontation skills and getting it out at the beginning of a situation rather than holding it in until it explodes. Teach aides and teachers about the destructiveness of gossip.

Training of aides together with the teachers so teachers can know what the aides are able and supposed to do.

9. What training do the teachers at your grade level need to work successfully with a Project Assist aide?

Palm

Teachers need to know what aide is capable of doing; teachers fear that aides are ruffians off the street, need confidence and familiarity with aide; also aide's responsibilities should be perfectly clear.

Especially at first, didn't know what Project Assist aide's job was. Teachers didn't understand LEIR very well: Consultant came over, but she only worked with one 5th grade teacher on LEIR.

A week of doing work with the teachers, so teachers will understand aide's abilities, restrictions.

Need to know how to use a lesson plan in co-operation with a Project Assist aide, aide got very little explanation of the lesson plan process.

Not to assign Project Assist aides to make materials, grade papers, put up bulletin boards during instructional time.

Include teachers on the in-service training in the summer etc. in which aides are trained. Also school the teachers in capabilities and limitations of the aides.

Palm

Not to be so demanding, but more importantly to understand completely the role and job of a Project Assist aide. Aides should be allowed time and opportunity to plan with the teacher during each week.

It follows from common sense.

Some counseling necessary for teachers that don't like Project Assist aides (or any aides). Some teacher should straighten out such teachers (who have power complexes). Aide should have some person or recourse.

I don't know (my teachers don't usually work with me).

Such training that she will always be prepared with a lesson planning and/or schedule for the aide in upcoming period.

All teachers competent.

Martin

Teachers and Project Assist aides should always have practice together before going into an actual classroom. Also the aide should have a chance to be alone with a group of kids.

Training to teach them what aides are supposed to do.

If we could all go to training a couple of weeks together and have an outline to work by.

None - they seem to have always worked well with the aides.

Training in how to use the aides (teachers were at loose ends at first. Now they do O.K.). In-service for teachers seemed to help them. We were mostly doing maid jobs at first.

None.

Confrontation training for the teachers.

Need to know what our jobs are. Pre-school joint teacher-aide training will help. (Maybe aides should not be put into a class with a first year teacher).

Training in dividing up the class for two instructional people in the class. Training to teach the teacher what aides can do. Training in how to professionally communicate with the aides in classrooms in front of students.

10. Do you feel that students' attitude toward reading has improved this year?

To what do you attribute this change?

Individualized attention; and LEIR program has helped a little bit.

Some change noted in that there were some Scholastic Books on many levels that kids would pick out on their own and read, but usually this wouldn't happen.

Aides individualized instruction; the new materials made and utilized.

(Kids came to aide and asked to read with aide). Reason was having someone (aide) sitting with the kids, encouraging and listening.

Kids have picked up a general familiarity with books, including making their their own books, thus getting into reading books easier.

Individual attention, working with kids one-to-one.

Metz

1	2	3	4	5
1		1		1
1		3		5

No change Definitely improved

To what do you attribute this change?

Because of the very fact of knowing how to read better, feeling more successful.

No comment.

Not sure - books are well illustrated, that's important for kindergarten.

Their fun - stories, the colorfully illustrated paperback books we got.

Martin

1	2	3	4	5
		111		111
1		3		5

No change Definitely improved

To what do you attribute this change?

Students know that aide will report to their parents any flagrant lack of cooperation.

They have had an aide to ask questions to. Teachers are sometimes too busy to answer questions which aides have time to answer.

Taking time with the child and letting him select some of his own reading materials.

Having additional instructional help.

The individual and small group instruction. Most of the students won't read well or know how to use a dictionary without special help.

Don't know.

Think the reading lab is too boring for them; if anything their attitudes toward reading have worsened.

Materials were made available - they like them (colorful illustrations help). Enthusiasm of aide and teachers helps. Peeb my enthusiasm has rubbed off on them.

The training that the aides have had. New reading textbooks, e.g., a practice reader with a tape (provided by Project Assist). Working in small groups and getting involved - this is so important. The audex machines have helped too.

11. Do you feel that your teachers would like to have a Project Assist aide in their classrooms again next year?

Palm	<u>1</u>	111
Metz		111
Martin	11	111 11

14. Has your schedule been satisfactory this year?

1	<u>Palm</u>	
No	11	111
	Uncertain	Yes

How could it be improved?

Schedule has changed almost every month, good point was that this aide managed to make her own schedule. This worked excellently:

By allowing the aide to spend her total time with one teacher, rather than three.

Needed improving at first of the year, but okay now.

Aide should be put at one grade level only; the three grade level assignment was difficult because, for one thing, aide has to get materials for three different grade levels.

Two groups of kids see aide for a whole month at a time, but only every other month; continuity lost.

Metz

No

Uncertain

1111
Yes

How could your schedule be improved?

Not necessary, because aide is able to stay long enough with each group to help them effectively.

The changing of aides schedule by teachers is the aspect that should be eliminated. Much bickering, jealousy. It had to be changed so much at first of year.

No problems.

Could spend more time with one teacher at a time. Only in each room 1 1/2 hrs. a day and much of it is spent preparing and moving.

Maybe have aide assigned to classrooms in proximity of each other.

Well and evenly divided (already).

Martin

I

No

Uncertain

1111 111
Yes

How could your schedule be improved?

It's OK now.

I would like to stay with only 2 teachers and 1 grade level. Four teachers is too many for one aide to work with.

Don't have enough time to work with one child. Could fix it to stay in a class longer than I do.

None.

I would like to stick to one grade if I could.

I like working with different teachers instead of just one.

None.

None.

None.

15. What materials have you found most useful this year as a reading aide?

Palm

Sheets from coordinator with skills, checklists that aides can run off and keep; list of differences between Spanish and English - grammar, sounds, Games especially small games, word games, those made by aide.

Filmstrips, tape recorders (aide brought own from home), games, books (especially Scholastic Books which had little forms to check if they had been understood, liked the book, got the main idea etc.)

Materials made by aide (spent \$50 making own materials).

Games probably the most useful, flash cards like "Words all authors use" were good; aide used cards to get kids to extract key sounds from familiar words.

Dictionaries and word banks.

Filmstrips were good, games made by the aides, word lists from LEIR.

Metz

Hasn't had a chance to experience many materials.

Games with consonant and vowel sounds, also blends, flash cards useful; worksheets were major factor, since the completion of worksheets served as a diagnosis of how much the kids knew.

Art materials, game-making instruction and materials.

Flash cards, chalkboard, chalk, pretty and different books.

Not much contact or experience with specific materials.

Charts made out by a teacher (worksheets, to eliminate blackboard writing).

Martin

Project Assist materials from Scholastic books. Small paper-back books on social issues, ecology, psychology, etc.

Dictionaries, reading games, book series with questions in back (SRS), flash cards (very helpful!) 6th grade reading lab.

The books and legal-sized workbooks provided by Project Assist. Films that go along with some of the readings.

Hoffman readers, Plus four curriculum, Dr. Spello workbooks.

Reading inventory Mrs. Kemp gave us at the pre-school workshop.

Everything has come in handy.

None.

Not applicable (work in the reading lab).

Scholastic practice pads, Beyond the Block Books, Readers Digest, Pictocabularies.

Reader's Digest, the new practice readers ("A,B,C.") Control reader (used in reading lab, Pilot Readers kit, Career Choice material.

16. What materials would you like to have next year that you have not had this year?

Palm

No comment.

Reading kits or programmed materials; games; always need paper to laminate self-made materials, also tagboard.

Likes art materials, thinks kids could bring things from home, also tape recorders are nice.

"Speech to print phonetics" kit to use with top and low groups.

More easier reading materials for slow kids. (4th)

(Not familiar enough).

Martin

More films.

Spanish-English dictionaries (I worked with Mexican national).

Blank tape recordings for children to record on and play back for self-evaluation of their expression.

More Hoffman readers.

Any new kind of material that comes out:

No suggestions.

More reading games - had time for them but had not enough materials. These materials would provide motivation.

More practice pads (didn't have enough this year), filmstrip projector and (more of them) films for the room.

17. Do you think the Project Assist team meeting has been helpful this year?

No

Uncertain

Palm
11
Yes

How could it have been better?

Meetings might be effective once a month. Agenda helps, but not that important. Meeting should be used for reading ideas but not necessary to meet as frequently as year goes by. At first, very necessary.

The reason for effectiveness was the individual people themselves. Some sharing, interchange of ideas, and use of an agenda did help.

Team leader for the month should have weekly conversation with coordinator, then aides could be informed well and regularly.

Maybe once a month is plenty, after an initial period of once a week meetings. Someone from the evaluation office should be there.

Criticism (in the meeting) should be construed positively rather than negatively. Reason: Aides were brought on (to teachers) too strongly. Everyone was then critical of the Project Assist aides.

If the coordinator met with the aides sometimes. Principal said "Come to me first" but some problems were not of a nature that aides could solve with principal.

11
No

Matz
Uncertain

11
Yes

How could it have been better?

Meeting not carried off well this year: should be more organized.

Has not been going to meetings

Meetings haven't been coming off. Aides don't really cooperate in effecting meetings (They don't happen).

We didn't have any meetings this semester; didn't know who team leaders were.

(Has not had meetings).

Has not had meetings.

1
No

Martin
1
Uncertain

11 11
Yes

How could it have been better?

Project Assist representatives should always be here; Otherwise the problems and solutions usually are not heard and acted on.

None.

Everyone expressed themselves well this year. Feel we were a good team here at Martin.

All it was was gossip and complaints. If we're going to have meetings, it should be about our work. That's why I didn't care to go anymore.

By having more meetings (haven't had one for the last two months).

It was O.K.

If they were weekly and attendance was required, with an agenda. Just like a faculty meeting. No one takes our meetings seriously. They have not been enforced.

They need to be more frequent. If everyone attends with unbridging feeling about the meeting, the meeting will be effective. Need to know at the beginning of the year the purpose of the meeting.

Improve the aide attendance and involvement. The time (late in the afternoon) is not so good. Maybe a lunch period would be good. Have people bring out problems during the team meeting, not before or after it. Causes strife.

18. Do you think that the substitute aide position is a good one?

111
No

Palm
1
Uncertain

11
Yes

Why?

Evaluator has list of reasons why this aide thinks the position is a good one. Substitute must be reliable.

Depends heavily on the person - she must be flexible, pleasant and easy-going, not of the type that will become self-serving or conceited by the position.

Takes a certain personality and capabilities to perform and get along with the job. Some resent having to substitute; some are not dependable.

Substitute aide typically comes in, is not familiar with the children, materials, levels or sequence of instruction. Often more than one is absent, and the teacher is without an aide anyway; also teachers get accustomed to an aide, and use her integrally - cannot so use a substitute.

Good for teachers because they are not left up in the air in case of aide absence, students profit in that they have an aide rather than being without.

Conflict of responsibility over the same kids. Substitute tends to "horn in" on aide's plans, methods. Substitute also comes to think of self as superior.

11
No

Mats
Uncertain

111
Yes

Why?

Absences probably occur because of the very fact that there is a substitute aide present to take one's place.

Because an aide is helpful and almost necessary, so work needs to be done.

Absences should be substituted for.

Substitute aide didn't know what she was supposed to do in my class. If more than one aide absent, teachers fought over who was to get her.

What would the aide do when no one absent?

Because kids get used to a second teacher figure.

111
No

Martin
Uncertain

111
Yes

Why?

The lack of an aide for some teachers is serious. Teachers who have come to be helpless without an aide.

Lot of aide absenteeism. A substitute would keep students from having to go back to the teacher with her students.

It's a problem adjusting to different teachers and their schedules. Teachers may not want someone new coming in.

If she knows what's going on in all the classes. She would have to work with them occasionally when they're not absent to learn what she's doing.

It was too much absenteeism for the substitute to handle. I felt like I neglected my own work when serving also as the substitute. Enjoyed getting to know all the teachers and students.

When another aide is out, you can take over for her class, and students don't get behind.

She never could get familiar enough to feel secure in what she was doing. Think it is a waste of time and money.

Because it provides someone who will be there who can teach students even if I can't be there.

Substitute aide chosen was shy. Not very interested in job. We do need a substitute aide though.

19. Do you feel that parents and the community have gotten involved in your school this year as a result of Project Assist?

Palm

11
No

11
Uncertain

11
Yes

How could parents get more involved in your school?

Not sure; aide not sure how news could be disseminated.

Fiestas, parties, dinners, Mexican suppers, anything where the parents are not only invited but are an integral part of the occasion and have all the responsibility e.g., building bookcases, having talent show, raising funds.

More school representatives going to homes to explain school. Some kind of meeting should happen once a month with parents, even in somebody's home.

They would need to come to visit the school more often or to PTA.

Aide thinks obstacles would be great in overcoming parental inert and getting them into school.

They know nothing about Project Assist, but are so resistant to involvement that aide has no good ideas. A few parents who have attended seemed scared, afraid of teachers' rejection.

Metz

1111
No Uncertain Yes

How could parents get more involved in your school?

No comment.

They're probably getting involved, as measured by the Metz Parents Conference Chart.

Productions like a current "drama" being put on by kindergarten.

Invite them to come see what their children are doing. That way they could help them at home.

No comment.

Representatives need to go out and visit.

Martin

11 1111 11
No Uncertain Yes

How could parents get more involved in your school?

Good idea to have a fiesta, get-together of the open house type. PTA is not that effective. Good ideas to have a regular checklist and sent home every month, then parents could respond with a visit.

If parents could be told that aides (Mexican American) are there to talk with them about their children, they might come more.

Send invitations to visit the school. Each child who brings a parent could get a reward. This might encourage other students to bring their parents.

Could get teachers to call parents for more conferences, instead of ignoring them like some teachers do.

By having more parent-involving events like carnivals or bazaars. They will not come to PTA meetings. Parents will come to school to watch their children perform.

No suggestions.

Things like the Cultural Arts Fair. More programs pertaining to their children would get them here.

If we made an all out effort to talk to parents in the homes. Don't really know though.

Before school starts, aides go out in two's and talk to parents about school and the program. Many parents are embarrassed because of their English. They should be invited. Maybe if school notices were sent home in Spanish it would help.

20. How do you feel that Project Assist aides can contribute to and help improve Project Assist throughout the year?

Pain

There should be a person who can supervise the three schools, observing and scheduling conferences immediately to solve problems.

More contact with the coordinator. This aide didn't know about her upcoming termination until the end of the year, whereas the coordinator knew about the possibility long in advance.

Team leader, at each meeting could ask for suggestions and find out each aide's situation weekly. Then team leader could make sure coordinator gets the message.

No reply.

Aides could be included in grade-level meetings.

No reply.

Matz

Aides should have someone to turn to when they have a problem, to give aides a suggestion or solution when they have a problem.

Talking with most teachers can help solve problems.

The idea of the team leaders, or better yet, have someone with real authority available to solve problems, talk to teachers here.

Have coordinator sit down and evaluate us on a regular basis and give us suggestions. She could go over the observation forms with us.

Not here long enough to know.

Having meetings.

Martin

By having somebody here who represents Project Assist who is authorized to do something about problems and needs. Project Coordinator usually is unreachable.

We could get paid more (we do as much as teachers and get the problem kids too).

Keeping themselves aware of new materials. Attend more aide training. Visit public libraries. Continue to attend out of town conventions.

Not miss so many days. Turn in our logs. Attend all our inservice training sessions.

More communication with our coordinator. She could come to our meetings once a month, just to talk to us.

No suggestions.

By having more frequent contact with project staff and get-togethers with all Project Assist aides. Have coordinator visit with us on our campuses.

If we were made aware of what was going on by Project staff, we could make suggestions about the program. If we don't know what's happening we can't have input.

No comment.

21. Do you feel that there is more work required of Project Assist aides than of other aides in your school?

	<u>Palm</u>	
1	1	1111
No	Uncertain	Yes

Comments:

Project aides are making materials less than others.

Project Assist aides are the only ones who are supposed to be "trained" in a specific field. Result: when teachers were called out, Project Assist aides had to substitute. In addition, Project Assist aides must do all the ordinary materials making.

Instruction itself makes for more work especially if aide must make materials and do the regular out-of-class work that most aides do. Teachers depend more on instructional aides.

Project Assist aides are under too much pressure; aides should be observed maybe once a month, neither constant observation nor frequent filling out of all types of forms are necessary.

More planning rather than overall work. Other aides are making materials while Project Assist aides are planning and working.

Project Assist aides do more planning on their own must then talk to teachers about implementation of plans, and usually have to get materials on their own.

	<u>Metz</u>	
1	111	1
No	Uncertain	Yes

Comments:

Since Project Assist aides are reading aides, there is more work required. Some planning is expected, not asked.

No comment.

Not sure of comparison.

Don't know what other aides do.

Not here long enough to know.

Project Assist aides have to serve teachers.

	<u>Martin</u>	
111 1	1	11
No	Uncertain	Yes

Comments:

Either they didn't have a good leader or they didn't know what they were supposed to do.

Thinks everyone is equal in responsibility.

I think all aides are doing real good work here.

The two jobs are totally different. Can make no comparison.

In general, people know we're instructional and they expect it and then some. Project Assist aides are expected to grade papers as well, which makes it kind of double duty for Project Assist aides.

22. Do you feel comfortable or uncomfortable when the observers are in your classroom observing you?

Palm

1		
Uncomfortable	Uncertain	Comfortable

If uncomfortable, how could this be changed?

If too close, it can make the aide uncomfortable.

In beginning uncomfortable, towards end of year comfortable.
No observer should sit right next to the aide being observed.

Just getting used to it will cure these feelings, aide would feel better being observed by the head of the program who could do something about any problem arising.

Metz

11		
Uncomfortable	Uncertain	Comfortable

If uncomfortable, how could this be changed?

Don't mind the idea of observation, but thinks there's no reason to be observed every week. Gets nervous in observation.

No observation.

Uncomfortable in one teacher's room; very comfortable in other teacher's rooms.

Wish they wouldn't sit so close to us. The closer the observer, the less attention the group pays to me.

No observation.

No observation.

~~111~~ 111
Comfortable

No comment'

At first it was uncomfortable, but later didn't even notice them.

- Year

Aide not sure how often other aides were absent.

Only reasons are individual ones, at least as far as this aide knows.

Because they are not satisfied with their jobs - some of the teachers were a reason, in that they expected Project Assist aides to make materials all the time.

Teachers have been very unpleasant to work with, especially in excessive talk behind the backs of the Project Assist aides.

Because of the attitude of some school personnel toward (some) Project Assist aides.

	<u>Matz</u>	
	11	11
No	Uncertain	Yes

Why do you think aides have been absent?

Doesn't know why they are absent, unless they just don't want to come to work.

Not sure why.

I don't know.

No evidence.

No evidence.

	<u>Martin</u>	
	11	11
No	Uncertain	Yes

Why do you think aides have been absent?

No comment.

No comment.

No comment.

No comment.

Couldn't say. But it has caused a lot of problems.

No comment.

My first year to work, and my first year of marriage. I have just begun to adjust to the importance of good attendance.

When the aide and teachers don't along, the aide is absent more. In this school there is a health problem (nervousness) with one aide. Some aides are just careless about attendance.

Most absences happen on Mondays and Fridays. Maybe aides should be reminded in training that it's important to be here. There has to be an improvement.

4. Are you interested in returning to Project Assist next year as an aide?

11
No

Palm
Uncertain

1111
Yes

Why?

Going to graduate school, but would not want to come back anyway. Teachers looked down on aides, made an obvious pecking order; aides obviously put at bottom.

Aide enjoys the work with children and feels like she has helped the ones she has worked with.

Aide has put a lot into the work this year, and would hate to lose it, likes the kids very much.

Aide "didn't like it" she felt insecure. Also she prefers having a general kind of teaching task, not only on one subject all day. (Prefers the work she did previously as an aide)

Because of children.

Really enjoy the work (with the kids), but has had some hassles.

Mats

1

1111

No

Uncertain

Yes

Why?

The distance from home to work.

Enjoy the work.

Wants to work with kids, especially after kids.

I love working with the little kids. Not attached to some.
They're funny and cute.

Like to work here, teachers and the kids.

Generally likes working with the kids.

Martin

11

1111 11

No

Uncertain

Yes

Why?

I like working with the kids.

I like the job, always have. Now I have the opportunity to
help students.

I like working with the kids, and it's an experience for me too.

I like what I'm doing.

Yes - if pay will increase. Because of the students, teachers,
and the principal has made me feel my maturity has helped at
the school.

I don't think I'm good enough. I enjoyed it at the end of the
year. Like working with students, but don't know what happened.

I'm beginning to think I'm too young to work with junior high
kids. Maybe having training would help. Maybe elementary
school would be OK for me ???

I'm getting married this summer and moving out of the city.

Because I have improved so much in confidence and ability. I
like the kids (hate the salary). I plan to be a teacher and
this gives me the experience I need to get ready for it. Many
sides are not coming back if the salary does not improve.

25. What has been your biggest disappointment with Project Assist?

Pain

Has overlooked many disappointments, once there were many problems that an aide has gotten through.

Teachers and aides needed workbooks (and training) in how to use LEIR, and kids were unprepared skill-wise in how to do the things that LEIR demanded. Result: Kids only wanted LEIR for the games and fun, not for learning. Never was able to get a LEIR consultant to come in and demonstrate what she demonstrated to other classes. Aide was taken out of classroom where she was actively instructing in the middle of a lesson, just to take a picture with an ice cream machine (which was not typical of aide's activities).

Aides were not well introduced to the schools at the beginning of the year. Teachers began to resent Project Assist aides, as did bilingual aides, because Project Assist aides wouldn't (couldn't) do many things aides were expected to do.

(See #24) Aide thinks it is bad to be so totally restricted from doing many things that a child needs, reading is only a small part of the things necessary for him.

Not the project as such, but how it was introduced and integrated into Pain school and the school personnel. Teachers were unprepared; principal and teachers were very negative or felt let down after Project Assist build-up at first of the year.

Working with principal that lacked experience, didn't know how to handle personnel. (Other things said by aide she didn't want recorded).

Metz

Aides didn't get enough training. This aide didn't get any real training when started.

None.

Aides have no one to talk to, who can solve teacher conflicts. One aide left partly because of a teacher problem.

That so many of the girls left. Think they should have stuck it out.

Principal prepared aide well - no disappointment.

None

Martin

No representative from Project Assist to help out here. Noticeable in team meetings. Aide has noticed some person with authority in all meetings except these Project Assist team meetings.

The salary.

No disappointments.

The way the Aides gripe about things.

No disappointment.

No disappointment.

No disappointment (it was all I expected it to be).

Started off so gung-ho and enthusiastic and now we don't even hear from anyone or know what's happening. It's kind of a letdown.

Some of the people quitting in the middle of the year. Gossip among Project Assist aides. Attendance of aides.

26. Do you have any other comments about the program which you would like to make?

Palm

Aides are the grass roots of the problem, but seem not to get the attention of administrators of the program. With a 50% absentee rate sometimes, it seems the main thrust of the project (aides teaching kids) needs to have the most attention. Aides with free time (lunch etc) should not waste it sitting around, but spend it in the library, etc.

Aide thought aides were primary concern of the coordinator, but they rarely see her. Much can go wrong with this lack of contact, to wit: the firing of this aide.

Included elsewhere.

Rotating among five centers of kids per room, and alternating kids after mixing them (two kindergarten teachers intermingled their kids). Aide worked with the five groups at one time. Some of the teachers didn't like LEIR, didn't think it is "worth it".

No comment.

No comment.

Mary

Aide is adamant about more training and getting materials.

Aides have been told they would get materials, then didn't get them.

Thinks all teachers need an aide.

No comment.

I like it. I think it's really helping the kids on their reading. Have extra people to help them.

Thinks helping kids and teachers is great idea.

Just great - teachers need all the help they can get.

Martin

Some people should be hired for, or have time, to counsel kids with problems or personal conflicts. No one here at Martin is young and able to identify closely with kids of different races, and yet is in authority too.

None

I hope it continues and maybe spreads into other areas where kids need help in reading too.

None

I'm very happy with the project.

No

Why did reading lab aides have to go to the reading conference at the Coliseum? It didn't seem to relate too well to my work in the lab. Our work is pretty unoriginal. In a way that's good for uncreative people like me.

In hiring aides, it would be good if applicants were given tests in areas they will be teaching, especially English and reading. In workshop we studied lots, but our own learning and ability was not assessed. Of the nine aides at Martin, three definitely have English skills problems. This situation has been embarrassing to these three and to the other aides.

Think it's a nice program.

27. Have you been asked to substitute for a teacher?

Palm

No

MH 1

Yes

If yes, how often and for how long?

Three or four times, and only until the substitute arrives.

Four times - 30 minutes to two hours.

About six entire days, and about 25 times for a few minutes to an hour.

One whole day one time, a couple of other times for 30 - 45 minutes.

Five to six times, each more than 30 minutes. This doesn't count 15 minutes substitutions.

Half day.

Metz

111

No

111

Yes

If you, how often and for how long?

Seven-eight times, once an hour, other times 15-20 minutes.

Not been asked to, but when teacher has a phone call, aide is the substitute.

262

No

No

Four-five, about 20-25 minutes while teacher calls parents.

Once, an hour.

1111
No

Martin

1111
Yes

If yes, how often and for how long?

Once for one hour.

Three times for one hour each time.

Three times for two hours each time.

Four times for one hour each time.

Three times for five - ten minutes each time.

ADMINISTRATION AND DESCRIPTION OF AIDE INTERVIEW INSTRUMENT

The aide interview was given on a one-to-one basis to each of the 23 Project Assist reading aides in the three experimental schools. It was administered in mid-May 1974, one to two weeks before school was out, in school workrooms, lounges, and libraries. The interviewers were the project evaluator and a classroom observer, both of whom had interviewing experience.

The interview form consists of 27 questions, most of them open-ended, constructed to elicit aides' perceptions of the effects, problems, and suggestions for the program next year. The rationale for the administration of this instrument was that the aides had worked "on the front lines" of the program, and their perceptions should be gathered and bear great weight in the planning of next year's program.

The instrument was developed by project evaluation personnel with input from the project coordinator. The instrument was not standardized. Its face validity appears to be strong, however its actual validity may be weakened by aides' unwillingness to be forthright and candid in their responses to project personnel.

INSTRUMENT REPORT

CASE STUDIES

"A Day in the Life of Two Project Assist Aides"

Date/Period of Administration: May, 1974

Population: Two Project Assist Aides

Data Collected by: Two Project Assist Classroom Observers

Data Collection Supervised by: Office of Evaluation

INTRODUCTION

Project Assist, funded by the Emergency School Assistance Act, trains teacher aides and channels them into Martin Junior High and Metz and Palm Elementary Schools of the Austin Independent School District. Their training and work are specifically reading-oriented. Expectations are that classroom environments equipped with trained teacher aides will prove more effective in raising student reading levels than classroom environments with general teacher aides or no teacher aides at all.

The following personal sketches of teacher aides are given to provide a clearer picture of them as individuals and to provide a general description of their daily activities.

Project Assist aides were selected at random for this study. Since the project works at both junior high and elementary school levels, two personal sketches were provided. Mrs. Linda Garza was chosen to represent the junior high level and Mrs. Juanita Lopez the elementary level.

In this study the two aides were observed throughout the day by process evaluators who had heretofore observed them only during 45-minute observations conducted at intervals during year. To add to the study, the backgrounds and opinions of the two aides were discussed during informal conversations with them. The aides have kindly consented to the use of their experiences in this report.

A Project ASSIST Reading Aide's Day at an Elementary School

Mrs. Juanita Lopez is convinced that children need an education to get what they want out of life. She thinks teacher aides are the key people in unlocking education to the student who needs individual attention. Inflexible schedules and lack of personnel make it difficult to give attention to the many children who need it, she says.

Mrs. Lopez moved to Austin from Edinburg, Texas, when she was very young. She attended local Austin schools: Palm, Govalle, and Allan, graduating from Johnston High School in 1966. After a year's experience at Metz School, she has developed both techniques and opinions on education. She feels that a teacher aide should have students read out loud regularly so as to diagnose difficulties they may be having. She should then formulate a list of words missed to use in drills and reviews.

Like most bilingual educators she feels that native Spanish-speaking children learn to read English better if they learn to read in Spanish first. She adds: "Judging from teacher comments and my own observation, I'm sure that the best readers in Spanish are also the best readers in English. Once the child establishes a good foundation in his own language, it is easier to function in a second language."

Mrs. Lopez begins her day by checking in at the Metz office, then proceeds to the workroom to get things together, including materials she makes for the classroom. From 8:00 to 9:30 she is in Mrs. Escobar's room with two groups of six students. She alternates with the groups every other day. The children have a number of activities in these small groups: writing sentences on the board to practice handwriting; reviewing flashcards that Mrs. Lopez has made for them (for difficult words); and reading orally

4 from the Southwest Reading Laboratory reading curriculum.

At 9:30 she is in Mrs. Guerra's class to work on a one-to-one basis with several children. She reviews their worksheets to ascertain their problems, then gives the needed individual attention. The worksheets are made out by the teacher and usually deal with phonics or comprehension. Afterwards students read individually to Mrs. Lopez. As they read, of course, she is compiling a new list of difficult words for them to recognize and pronounce. Pronunciation drills and exercises are the last step in the sequence. This sequence is designed so children will make gains in both pronunciation and vocabulary.

After thirty minutes for lunch, Mrs. Lopez has some time to plan with the teacher while the children are resting after lunch. They discuss priorities and techniques, even new word games during this period. Until 1:00 Mrs. Lopez helps students with math problems, both in reading them and understanding the concepts.

Then in Mrs. Attal's class she is back to reading, tutoring individually. She allows about twenty minutes per child. Often she concentrates on letter-sound recognition, pronouncing words and letting the child pronounce the words. Later she may grade a test devised by the teacher to assess progress in basal readers.

From 2:30 to 4:00 Mrs. Lopez has her work period. She must divide this time between different teachers. The best method is to give each teacher a different day, rather than divide the period among several teachers.

Mrs. Lopez comments that her work has made her more aware of learning activities which she will use with her own two children. She has already taught them reading readiness concepts, employing the most familiar letters,

numbers, and colors. Her reason: "I don't want my daughter to experience the common problem of coming to school without the basic learning concepts needed for the first grade."

A Project ASSIST Reading Aide's Day at a Junior High School

Linda Garza, a young lady in her early twenties, has always thought that a teacher aide is a vital person in the schools, one that helps fill the gap between the teacher and the many children committed to her charge. She began early in that role: at age sixteen, she worked through the Neighborhood Youth Corps helping teachers at Allan Junior High where she was also a student. Interested mostly in reading, she continued her work in the tenth grade at Johnston High where she worked as a reading tutor.

When her family left Texas for Michigan, Mrs. Garza was offered a job in a migrant program as a teacher aide and has continued that work whenever possible up to the present. She was referred to Project ASSIST by Mr. Andrew Rodriquez of S.E.R. - Jobs in Progress, Inc. in Austin. She is now taking courses toward her G.E.D. which she expects to complete in August.

Mrs. Garza has developed a certain sequence of activities that she finds especially effective. She often takes a few new words together and begins by explaining their meanings. The students then make sentences with the words and break them into syllables. Next Mrs. Garza asks for examples of the students' own use of the words. She conducts a review, then gives a short test.

She finds that being positive and kind with students pays dividends. Reinforcement of desired behavior comes naturally to her, and she enjoys work with students near her own age.

On a typical day at Martin Junior High Mrs. Garza has a variety of assignments. During first period she tutors three students who are Mexican nationals recently arrived in Texas. She introduces new words to them slowly.

After students encounter the words in a story, she uses them in sentences and translates if necessary, but sets a limit on translations. After a short study she reviews their words with them, often utilizing flash cards that she makes specially for individual groups.

During the second period she is free for making materials, discussing future lessons with teachers, catching up or just relaxing. In the teachers' lounge she encounters aides and teachers who are also free during the second period. The library offers shelter, reference, and the daily paper.

During the third period Mrs. Garza supervises three 7th grade students as they work on social studies assignments. Under her advisement they read the current chapter and look up words in the back of the book. She supplements the reading assignments with a student periodical entitled Know Your World. After about a week per chapter the students are ready for a test. Mrs. Garza and other aides regularly take small groups out of the classroom since the noise level is often high. Students concentrate better in another setting and enjoy a change of scenery.

During the fourth period Mrs. Garza works in the sixth grade reading lab. The class is divided into four groups because there are three aides and a teacher available during this period. In this situation there is a good diversity of instruction. A typical period might see a phonics lesson in one group, SRA materials in another, and two groups reading a mystery or stories from a supplementary reader Sea Hunt.

Lunch follows and allows only thirty minutes for a break in the schedule. Mrs. Garza usually chooses not to eat lunch but spends the time in the cafeteria with friends.

During the fifth period she helps Mrs. Johnson. Sometimes she spends the period with one or two students who have been absent and must catch up with their class.

The last class of the day is sixth period. Mrs. Garza usually tutors three students from Mr. Conde's English class, always taking them to the reading coordinator's room. These are students who do not cooperate well with the teacher, and they respond much better in this special situation. Some joking and talking is allowed, and Mrs. Garza feels she plays a "big sister" part with them.

The academic day winds up at 3:30, and both aides and teachers have another half hour to review and plan. Besides planning and organizing, they need to compare notes and solve various logistical problems, often due to lack of space or personnel. If this was a typical day, Mrs. Garza probably divided her time among twenty students, providing individual attention that would be impossible without her.

INSTRUMENT REPORT

PRINCIPAL QUESTIONNAIRE REPORT

Date/Period of Administration: October, 1973

Population: Principals at Palm, Metz, and Martin

Data Collected By: Office of Evaluation Staff

Data Collection Supervised By: Office of Evaluation Staff

INTRODUCTION

In October, 1973, during the first project year, a principal questionnaire was administered to ascertain principal reactions to the implementation and apparent success of Project Assist. Questions concerning the regular school program and other special programs were asked, but only their responses to the questions about Project Assist are reported here.

RESULTS

The responses of the principals at the three project schools are tallied in Table Q-1. The principals agreed strongly that project staff had been of assistance to the school staff in implementing the program, and, generally speaking, that the materials provided were adequate to implement the program. They agreed that aides cared about students and their learning progress, and that aides exhibited initiative. They also agreed that aides did a good job with students when working alone and provided extra individual attention and instruction, and that students responded well to the aides. Principals were not as confident about the training the aides received, or that aides could effectively assist in diagnosing student reading problems. They were not sure whether students would learn less or the same if aides were taken out of their schools.

SUMMARY

At the beginning of the first project year, principals agreed strongly that Project Assist staff assistance and materials had been adequate to implement the program. Principals expressed confidence about some aide capabilities and doubts about others.

Table Q-1: RESPONSES OF PRINCIPALS AT PALM, METZ, AND MARTIN TO
PRINCIPAL QUESTIONNAIRE, OCTOBER, 1973

<p>If aides are present in your school, please answer the following items, circling the letter of the response which best describes your answer, using the following scale:</p> <p>a. Completely disagree b. Disagree c. No opinion d. Agree e. Completely agree</p>					
20. The teacher aides in my school really care about the students and their learning progress.	a	b	c	d	111 e
21. The teacher aides in my school exhibit initiative in working with students.	a	b	c	d	111 e
22. The teacher aides in my school have been well trained for their job.	a	b	c	d	111 e
23. The teacher aides in my school can effectively assist in diagnosing student reading problems.	a	b	c	d	111 e
24. The students in my school respond well to the teacher aides.	a	b	c	d	111 e
25. When the teacher aides in my school are working alone helping students, I feel sure they are doing a good job.	a	b	c	d	111 e
26. If the teacher aides were taken out of my school, the students would learn a lot less.	a	b	c	d	1 11 e
27. If the teacher aides were taken out of my school, the students would receive much less individual attention and instruction.	a	b	c	d	1 11 e
36. The people in ESAA, Project Assist have been of assistance to you and your staff in implementing the program.	a	b	c	d	111 e
37. The materials provided for ESAA, Project Assist have been adequate to meet the needs of implementing the program.	a	b	c	d	1 11 e
